|               | <pre>Device(config)# policy-map policy_queuebuffer01 Device(config-pmap)#</pre>                                                                                                                                                       | Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <p><b>class</b> <i>class name</i></p> <p><b>Example:</b></p> <pre>Device(config-pmap)# class class_queuebuffer01 Device(config-pmap-c)#</pre>                                                                                         | <p>Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following:</p> <ul style="list-style-type: none"> <li>• <i>word</i>—Class map name.</li> <li>• <b>class-default</b>—System default class matching any otherwise unclassified packets.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 4</b> | <p><b>bandwidth</b> {<i>Kb/s</i>   <b>percent</b> <i>percentage</i>   <b>remaining</b> { <b>ratio</b> <i>ratio value</i> } }</p> <p><b>Example:</b></p> <pre>Device(config-pmap-c)# bandwidth percent 80 Device(config-pmap-c)#</pre> | <p>Configures the bandwidth for the policy map. The command parameters include:</p> <ul style="list-style-type: none"> <li>• <i>Kb/s</i>—Use this command to configure a specific value. The range is 20000 to 10000000.</li> <li>• <b>percent</b>—Allocates a minimum bandwidth to a particular class using a percentage. The queue can oversubscribe bandwidth in case other queues do not utilize the entire port bandwidth. The total sum cannot exceed 100 percent, and in case it is less than 100 percent, the rest of the bandwidth is equally divided along all bandwidth queues.</li> <li>• <b>remaining</b>—Allocates a minimum bandwidth to a particular class. The queue can oversubscribe bandwidth in case other queues do not utilize entire port bandwidth. The total sum cannot exceed 100 percent. It is preferred to use this command when the <b>priority</b> command is used for certain queues in the policy. You can also assign ratios rather than a percentage to each queue; the queues will be assigned certain weights that are inline with these ratios. Ratios can range from 0 to 100. Total bandwidth ratio allocation for the policy in this case can exceed 100.</li> </ul> <p><b>Note</b> You cannot mix bandwidth types on a policy map.</p> |
| <b>Step 5</b> | <p><b>queue-buffers</b> {<b>ratio</b> <i>ratio value</i>}</p> <p><b>Example:</b></p> <pre>Device(config-pmap-c)# queue-buffers ratio 10 Device(config-pmap-c)#</pre>                                                                  | <p>Configures the relative buffer size for the queue.</p> <p><b>Note</b> The sum of all configured buffers in a policy must be less than or equal to 100 percent. Unallocated buffers are evenly distributed to all the remaining queues. Ensure sufficient buffers are allocated to all queues including the priority queues.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|               | Command or Action                                                               | Purpose                                                                                                                                                                                                                                                                    |
|---------------|---------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                 | <b>Note</b> Protocol Data Units(PDUs) for network control protocols such as spanning-tree and LACP utilize the priority queue or queue 0 (when a priority queue is not configured). Ensure sufficient buffers are allocated to these queues for the protocols to function. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config-pmap-c) # end Device#</pre> | Saves configuration changes.                                                                                                                                                                                                                                               |
| <b>Step 7</b> | <b>show policy-map</b><br><b>Example:</b><br><pre>Device# show policy-map</pre> | (Optional) Displays policy configuration information for all classes configured for all service policies.                                                                                                                                                                  |

**What to do next**

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or policies to an interface using the **service-policy** command.

**Configuring Queue Limits (CLI)**

You use queue limits to configure Weighted Tail Drop (WTD). WTD ensures the configuration of more than one threshold per queue. Each class of service is dropped at a different threshold value to provide for QoS differentiation. With the , each queue has 3 explicit programmable threshold classes—0, 1, 2. Therefore, the enqueue/drop decision of each packet per queue is determined by the packet's threshold class assignment, which is determined by the DSCP, CoS, or QoS group field of the frame header.

WTD also uses a soft limit, and therefore you are allowed to configure the queue limit to up to 400 percent (maximum four times the reserved buffer from common pool). This soft limit prevents overrunning the common pool without impacting other features.

**Note** You can only configure queue limits on the egress queues on wired ports.

**Before you begin**

The following are prerequisites for this procedure:

- You should have created a class map for the queue limits before beginning this procedure.

- You must have configured either bandwidth, shape, or priority on the policy map prior to configuring the queue limits.

## SUMMARY STEPS

1. **configure terminal**
2. **policy-map** *policy name*
3. **class** *class name*
4. **bandwidth** {*Kb/s* | **percent** *percentage* | **remaining** { **ratio** *ratio value* }}
5. **queue-limit** {*packets packets* | **cos** {*cos value* { *maximum threshold value* | **percent** *percentage* } | **values** {*cos value* | **percent** *percentage* } } | **dscp** {*dscp value* { *maximum threshold value* | **percent** *percentage* } | **match packet** { *maximum threshold value* | **percent** *percentage* } | **default** { *maximum threshold value* | **percent** *percentage* } | **ef** { *maximum threshold value* | **percent** *percentage* } | **dscp values** *dscp value* } | **percent** *percentage* }
6. **end**
7. **show policy-map**

| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                               | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>policy-map</b> <i>policy name</i><br><b>Example:</b><br>Device(config)# <b>policy-map</b> <b>policy_queue-limit01</b><br>Device(config-pmap)#                                                                                | Enters policy map configuration mode.<br>Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.                                                                                                                                                                                                                                   |
| <b>Step 3</b> | <b>class</b> <i>class name</i><br><b>Example:</b><br>Device(config-pmap)# <b>class</b> <b>class_queue-limit01</b><br>Device(config-pmap-c)#                                                                                     | Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following: <ul style="list-style-type: none"> <li>• <i>word</i>—Class map name.</li> <li>• <b>class-default</b>—System default class matching any otherwise unclassified packets.</li> </ul> |
| <b>Step 4</b> | <b>bandwidth</b> { <i>Kb/s</i>   <b>percent</b> <i>percentage</i>   <b>remaining</b> { <b>ratio</b> <i>ratio value</i> }}<br><b>Example:</b><br>Device(config-pmap-c)# <b>bandwidth</b> <b>500000</b><br>Device(config-pmap-c)# | Configures the bandwidth for the policy map. The parameters include: <ul style="list-style-type: none"> <li>• <i>Kb/s</i>—Use this command to configure a specific value. The range is 20000 to 10000000.</li> <li>• <b>percent</b>—Allocates a minimum bandwidth to a particular class. The queue can oversubscribe</li> </ul>                                                         |

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>bandwidth in case other queues do not utilize the entire port bandwidth. The total sum cannot exceed 100 percent, and in case it is less than 100 percent, the rest of the bandwidth is equally divided along all bandwidth queues.</p> <ul style="list-style-type: none"> <li>• <b>remaining</b>—Allocates a minimum bandwidth to a particular class. The queue can oversubscribe bandwidth in case other queues do not utilize entire port bandwidth. The total sum cannot exceed 100 percent. It is preferred to use this command when the <b>priority</b> command is used for certain queues in the policy. You can also assign ratios rather than a percentage to each queue; the queues will be assigned certain weights that are inline with these ratios. Ratios can range from 0 to 100. Total bandwidth ratio allocation for the policy in this case can exceed 100.</li> </ul> <p><b>Note</b> You cannot mix bandwidth types on a policy map.</p> |
| Step 5 | <p><b>queue-limit</b> {<i>packets packets</i>   <b>cos</b> {<i>cos value</i> { <i>maximum threshold value</i>   <b>percent percentage</b> } }   <b>values</b> {<i>cos value</i>   <b>percent percentage</b> } }   <b>dscp</b> {<i>dscp value</i> { <i>maximum threshold value</i>   <b>percent percentage</b> }   <i>match packet</i> { <i>maximum threshold value</i>   <b>percent percentage</b> }   <b>default</b> { <i>maximum threshold value</i>   <b>percent percentage</b> }   <b>ef</b> { <i>maximum threshold value</i>   <b>percent percentage</b> }   <b>dscp values</b> <i>dscp value</i> }   <b>percent percentage</b> } }</p> <p><b>Example:</b></p> <pre>Device(config-pmap-c) # queue-limit dscp 3 percent 20 Device(config-pmap-c) # queue-limit dscp 4 percent 30 Device(config-pmap-c) # queue-limit dscp 5 percent 40</pre> | <p>Sets the queue limit threshold percentage values.</p> <p>With every queue, there are three thresholds (0,1,2), and there are default values for each of these thresholds. Use this command to change the default or any other queue limit threshold setting. For example, if DSCP 3, 4, and 5 packets are being sent into a specific queue in a configuration, then you can use this command to set the threshold percentages for these three DSCP values. For additional information about queue limit threshold values, see <a href="#">Weighted Tail Drop, on page 1202</a>.</p> <p><b>Note</b> The does not support absolute queue-limit percentages. The only supports DSCP or CoS queue-limit percentages.</p>                                                                                                                                                                                                                                         |
| Step 6 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-pmap-c) # end Device#</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Saves configuration changes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**What to do next**

Proceed to configure any additional policy maps for QoS for your network. After creating your policy maps, proceed to attach the traffic policy or polices to an interface using the **service-policy** command.

**Configuring Shaping (CLI)**

You use the **shape** command to configure shaping (maximum bandwidth) for a particular class. The queue's bandwidth is restricted to this value even though the port has additional bandwidth left. You can configure shaping as an average percent, as well as a shape average value in bits per second.

**Before you begin**

You should have created a class map for shaping before beginning this procedure.

**SUMMARY STEPS**

1. **configure terminal**
2. **policy-map** *policy name*
3. **class** *class name*
4. **shape average** {*target bit rate* | **percent** *percentage*}
5. **end**
6. **show policy-map**

**DETAILED STEPS**

### What to do next

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or policies to an interface using the **service-policy** command.

## Configuring Precious Metal Policies (CLI)

You can configure precious metal QoS policies on a per-WLAN basis.

### SUMMARY STEPS

1. **configure terminal**
2. **wlan** *wlan-name*
3. **service-policy** {**input** | **output**} *policy-name*
4. **end**
5. **show wlan** {*wlan-id* | *wlan-name*}

| <b>show ap name</b> <i>ap_name</i> <b>service-policy</b>                                                                                                                                                                                         | Displays all the policies configured on the AP.                                                                                                                                                                                                    |

## Configuration Examples for QoS

### Examples: Classification by Access Control Lists

This example shows how to classify packets for QoS by using access control lists (ACLs):

```
Device# configure terminal
Device(config)# access-list 101 permit ip host 12.4.1.1 host 15.2.1.1
Device(config)# class-map acl-101
Device(config-cmap)# description match on access-list 101
```

```
Device(config-cmap) # match access-group 101
Device(config-cmap) #
```

After creating a class map by using an ACL, you then create a policy map for the class, and apply the policy map to an interface for QoS.

## Examples: Class of Service Layer 2 Classification

This example shows how to classify packets for QoS using a class of service Layer 2 classification:

```
Device# configure terminal
Device(config) # class-map cos
Device(config-cmap) # match cos ?
 <0-7> Enter up to 4 class-of-service values separated by white-spaces
Device(config-cmap) # match cos 3 4 5
Device(config-cmap) #
```

After creating a class map by using a CoS Layer 2 classification, you then create a policy map for the class, and apply the policy map to an interface for QoS.

## Examples: Class of Service DSCP Classification

This example shows how to classify packets for QoS using a class of service DSCP classification:

```
Device# configure terminal
Device(config) # class-map dscp
Device(config-cmap) # match dscp af21 af22 af23
Device(config-cmap) #
```

After creating a class map by using a DSCP classification, you then create a policy map for the class, and apply the policy map to an interface for QoS.

## Examples: VLAN ID Layer 2 Classification

This example shows how to classify for QoS using a VLAN ID Layer 2 classification:

```
Device# configure terminal
Device(config) # class-map vlan-120
Device(config-cmap) # match vlan ?
 <1-4095> VLAN id
Device(config-cmap) # match vlan 120
Device(config-cmap) #
```

After creating a class map by using a VLAN Layer 2 classification, you then create a policy map for the class, and apply the policy map to an interface for QoS.

## Examples: Classification by DSCP or Precedence Values

This example shows how to classify packets by using DSCP or precedence values:

```
Device# configure terminal
Device(config)# class-map prec2
Device(config-cmap)# description matching precedence 2 packets
Device(config-cmap)# match ip precedence 2
Device(config-cmap)# exit
Device(config)# class-map ef
Device(config-cmap)# description EF traffic
Device(config-cmap)# match ip dscp ef
Device(config-cmap)#
```

After creating a class map by using a DSCP or precedence values, you then create a policy map for the class, and apply the policy map to an interface for QoS.

## Examples: Hierarchical Classification

The following is an example of a hierarchical classification, where a class named parent is created, which matches another class named child. The class named child matches based on the IP precedence being set to 2.

```
Device# configure terminal
Device(config)# class-map child
Device(config-cmap)# match ip precedence 2
Device(config-cmap)# exit
Device(config)# class-map parent
Device(config-cmap)# match class child
Device(config-cmap)#
```

After creating the parent class map, you then create a policy map for the class, and apply the policy map to an interface for QoS.

## Examples: Hierarchical Policy Configuration

The following is an example of a configuration using hierarchical policies:

```
Device# configure terminal
Device(config)# class-map c1
Device(config-cmap)# match dscp 30
Device(config-cmap)# exit

Device(config)# class-map c2
Device(config-cmap)# match precedence 4
Device(config-cmap)# exit

Device(config)# class-map c3
Device(config-cmap)# exit

Device(config)# policy-map child
```

```

Device(config-pmap) # class c1
Device(config-pmap-c) # priority level 1
Device(config-pmap-c) # police rate percent 20 conform-action transmit exceed action drop
Device(config-pmap-c-police) # exit
Device(config-pmap-c) # exit

Device(config-pmap) # class c2
Device(config-pmap-c) # bandwidth 20000
Device(config-pmap-c) # exit
Device(config-pmap) # class class-default
Device(config-pmap-c) # bandwidth 20000
Device(config-pmap-c) # exit
Device(config-pmap) # exit

Device(config) # policy-map parent
Device(config-pmap) # class class-default
Device(config-pmap-c) # shape average 1000000
Device(config-pmap-c) # service-policy child
Device(config-pmap-c) # end

```

The following example shows a hierarchical policy using table maps:

```

Device(config) # table-map dscp2dscp
 Device(config-tablemap) # default copy
Device(config) # table-map dscp2up
Device(config-tablemap) # map from 46 to 6
Device(config-tablemap) # map from 34 to 5
Device(config-tablemap) # default copy
Device(config) # policy-map ssid_child_policy
Device(config-pmap) # class voice
Device(config-pmap-c) # priority level 1
Device(config-pmap-c) # police 15000000
Device(config-pmap) # class video
Device(config-pmap-c) # priority level 2
Device(config-pmap-c) # police 10000000
Device(config) # policy-map ssid_policy
Device(config-pmap) # class class-default
Device(config-pmap-c) # shape average 30000000
Device(config-pmap-c) # queue-buffer ratio 0
Device(config-pmap-c) # set dscp dscp table dscp2dscp
Device(config-pmap-c) # service-policy ssid_child_policy

```

## Examples: Classification for Voice and Video

This example describes how to classify packet streams for voice and video using device specific information.

In this example, voice and video are coming in from end-point A into GigabitEthernet1/0/1 on the device and have precedence values of 5 and 6, respectively. Additionally, voice and video are also coming from end-point B into GigabitEthernet1/0/2 on the device with DSCP values of EF and AF11, respectively.

Assume that all the packets from the both the interfaces are sent on the uplink interface, and there is a requirement to police voice to 100 Mbps and video to 150 Mbps.

To classify per the above requirements, a class to match voice packets coming in on GigabitEthernet1/0/1 is created, named voice-interface-1, which matches precedence 5. Similarly another class for voice is created, named voice-interface-2, which will match voice packets in GigabitEthernet1/0/2. These classes are associated

to two separate policies named input-interface-1, which is attached to GigabitEthernet1/0/1, and input-interface-2, which is attached to GigabitEthernet1/0/2. The action for this class is to mark the qos-group to 10. To match packets with QoS-group 10 on the output interface, a class named voice is created which matches on QoS-group 10. This is then associated to another policy named output-interface, which is associated to the uplink interface. Video is handled in the same way, but matches on QoS-group 20.

The following example shows how classify using the above device specific information:

```

Device(config)#
Device(config)# class-map voice-interface-1
Device(config-cmap)# match ip precedence 5
Device(config-cmap)# exit

Device(config)# class-map video-interface-1
Device(config-cmap)# match ip precedence 6
Device(config-cmap)# exit

Device(config)# class-map voice-interface-2
Device(config-cmap)# match ip dscp ef
Device(config-cmap)# exit

Device(config)# class-map video-interface-2
Device(config-cmap)# match ip dscp af11
Device(config-cmap)# exit

Device(config)# policy-map input-interface-1
Device(config-pmap)# class voice-interface-1
Device(config-pmap-c)# set qos-group 10
Device(config-pmap-c)# exit

Device(config-pmap)# class video-interface-1
Device(config-pmap-c)# set qos-group 20

Device(config-pmap-c)# policy-map input-interface-2
Device(config-pmap)# class voice-interface-2
Device(config-pmap-c)# set qos-group 10
Device(config-pmap-c)# class video-interface-2
Device(config-pmap-c)# set qos-group 20
Device(config-pmap-c)# exit
Device(config-pmap-c)# exit
Device(config-pmap)# exit

Device(config)# class-map voice
Device(config-cmap)# match qos-group 10
Device(config-cmap)# exit

Device(config)# class-map video
Device(config-cmap)# match qos-group 20

Device(config)# policy-map output-interface
Device(config-pmap)# class voice
Device(config-pmap-c)# police 256000 conform-action transmit exceed-action drop
Device(config-pmap-c-police)# exit
Device(config-pmap-c)# exit

Device(config-pmap)# class video
Device(config-pmap-c)# police 1024000 conform-action transmit exceed-action drop
Device(config-pmap-c-police)# exit
Device(config-pmap-c)# exit

```

## Examples: Wireless QoS Policy Classified by Voice, Video, and Multicast Traffic

The following example provides a template for creating a port child policy for managing quality of service for voice and video traffic.

```
Policy-map port_child_policy
 Class voice (match dscp ef)
 Priority level 1
 Police Multicast Policer
 Class video (match dscp af41)
 Priority level 2
 Police Multicast Policer
 Class mcast-data (match non-client-nrt)
 Bandwidth remaining ratio <>
 Class class-default (NRT Data)
 Bandwidth remaining ratio <>
```

**Note** Multicast Policer in the example above is not a keyword. It refers to the policing policy configured.

Two class maps with name voice and video are configured with DSCP assignments of 46 and 34. The voice traffic is assigned the priority of 1 and the video traffic is assigned the priority level 2 and is processed using Q0 and Q1. If your network receives multicast voice and video traffic, you can configure multicast policers. The non-client NRT data and NRT data are processed using the Q2 and Q3 queues.

## Examples: Average Rate Shaping Configuration

The following example shows how to configure average rate shaping:

```

Device# configure terminal
Device(config)# class-map precl

```

```

Device(config-cmap) # description matching precedence 1 packets
Device(config-cmap) # match ip precedence 1
Device(config-cmap) # end

Device# configure terminal
Device(config) # class-map prec2
Device(config-cmap) # description matching precedence 2 packets
Device(config-cmap) # match ip precedence 2
Device(config-cmap) # exit

Device(config) # policy-map shaper
Device(config-pmap) # class prec1
Device(config-pmap-c) # shape average 512000
Device(config-pmap-c) # exit

Device(config-pmap) # policy-map shaper
Device(config-pmap) # class prec2
Device(config-pmap-c) # shape average 512000
Device(config-pmap-c) # exit

Device(config-pmap) # class class-default
Device(config-pmap-c) # shape average 1024000

```

After configuring the class maps, policy map, and shape averages for your configuration, proceed to then apply the policy map to the interface for QoS.

## Examples: Queue-limit Configuration

The following example shows how to configure a queue-limit policy based upon DSCP values and percentages:

```

Device# configure terminal
Device#(config) # policy-map port-queue
Device#(config-pmap) # class dscp-1-2-3
Device#(config-pmap-c) # bandwidth percent 20
Device#(config-pmap-c) # queue-limit dscp 1 percent 80
Device#(config-pmap-c) # queue-limit dscp 2 percent 90
Device#(config-pmap-c) # queue-limit dscp 3 percent 100
Device#(config-pmap-c) # exit

Device#(config-pmap) # class dscp-4-5-6
Device#(config-pmap-c) # bandwidth percent 20
Device#(config-pmap-c) # queue-limit dscp 4 percent 20
Device#(config-pmap-c) # queue-limit dscp 5 percent 30
Device#(config-pmap-c) # queue-limit dscp 6 percent 20
Device#(config-pmap-c) # exit

Device#(config-pmap) # class dscp-7-8-9
Device#(config-pmap-c) # bandwidth percent 20
Device#(config-pmap-c) # queue-limit dscp 7 percent 20
Device#(config-pmap-c) # queue-limit dscp 8 percent 30
Device#(config-pmap-c) # queue-limit dscp 9 percent 20
Device#(config-pmap-c) # exit

Device#(config-pmap) # class dscp-10-11-12
Device#(config-pmap-c) # bandwidth percent 20

```

```

Device# (config-pmap-c) # queue-limit dscp 10 percent 20
Device# (config-pmap-c) # queue-limit dscp 11 percent 30
Device# (config-pmap-c) # queue-limit dscp 12 percent 20
Device# (config-pmap-c) # exit

Device# (config-pmap) # class dscp-13-14-15
Device# (config-pmap-c) # bandwidth percent 10
Device# (config-pmap-c) # queue-limit dscp 13 percent 20
Device# (config-pmap-c) # queue-limit dscp 14 percent 30
Device# (config-pmap-c) # queue-limit dscp 15 percent 20
Device# (config-pmap-c) # end
Device#

```

After finishing with the above policy map queue-limit configuration, you can then proceed to apply the policy map to an interface for QoS.

## Examples: Policing Action Configuration

The following example displays the various policing actions that can be associated to the policer. These actions are accomplished using the conforming, exceeding, or violating packet configurations. You have the flexibility to drop, mark and transmit, or transmit packets that have exceeded or violated a traffic profile.

For example, a common deployment scenario is one where the enterprise customer polices traffic exiting the network towards the service provider and marks the conforming, exceeding and violating packets with different DSCP values. The service provider could then choose to drop the packets marked with the exceeded and violated DSCP values under cases of congestion, but may choose to transmit them when bandwidth is available.

**Note** The Layer 2 fields can be marked to include the CoS fields, and the Layer 3 fields can be marked to include the precedence and the DSCP fields.

One useful feature is the ability to associate multiple actions with an event. For example, you could set the precedence bit and the CoS for all conforming packets. A submode for an action configuration could then be provided by the policing feature.

This is an example of a policing action configuration:

```
Device# configure terminal
Device(config)# policy-map police
Device(config-pmap)# class class-default
Device(config-pmap-c)# police cir 1000000 pir 2000000
Device(config-pmap-c-police)# conform-action transmit
Device(config-pmap-c-police)# exceed-action set-dscp-transmit dscp table exceed-markdown-table
Device(config-pmap-c-police)# violate-action set-dscp-transmit dscp table
violate-markdown-table
Device(config-pmap-c-police)# end
```

In this example, the exceed-markdown-table and violate-mark-down-table are table maps.

**Note** Policer-based markdown actions are only supported using table maps. Only one markdown table map is allowed for each marking field in the device.

## Examples: Policer VLAN Configuration

The following example displays a VLAN policer configuration. At the end of this configuration, the VLAN policy map is applied to an interface for QoS.

```
Device# configure terminal
Device(config)# class-map vlan100
Device(config-cmap)# match vlan 100
Device(config-cmap)# exit
Device(config)# policy-map vlan100
Device(config-pmap)# policy-map class vlan100
Device(config-pmap-c)# police 100000 bc conform-action transmit exceed-action drop
Device(config-pmap-c-police)# end
Device# configure terminal
Device(config)# interface gigabitEthernet1/0/5
Device(config-if)# service-policy input vlan100
```

## Examples: Policing Units

The policing unit is the basis on which the token bucket works. CIR and PIR are specified in bits per second. The burst parameters are specified in bytes. This is the default mode; it is the unit that is assumed when no units are specified. The CIR and PIR can also be configured in percent, in which case the burst parameters have to be configured in milliseconds.

The following is an example of a policer configuration in bits per second. In this configuration, a dual-rate three-color policer is configured where the units of measurement is bits. The burst and peak burst are all specified in bits.

```
Device(config)# policy-map bps-policer
Device(config-pmap)# class class-default
Device(config-pmap-c)# police rate 100000 peak-rate 1000000
conform-action transmit exceed-action set-dscp-transmit
dscp table DSCP_EXCE violate-action drop
```

## Examples: Single-Rate Two-Color Policing Configuration

The following example shows how to configure a single-rate two-color policer:

```
Device(config)# class-map match-any precl
Device(config-cmap)# match ip precedence 1
Device(config-cmap)# exit
Device(config)# policy-map policer
Device(config-pmap)# class precl
Device(config-pmap-c)# police cir 256000 conform-action transmit exceed-action drop
Device(config-pmap-c-police)# exit
Device(config-pmap-c)#
```

## Examples: Dual-Rate Three-Color Policing Configuration

The following example shows how to configure a dual-rate three-color policer:

```
Device# configure terminal
Device(config)# policy-Map dual-rate-3color-policer
Device(config-pmap)# class class-default
Device(config-pmap-c)# police cir 64000 bc 2000 pir 128000 be 2000
Device(config-pmap-c-police)# conform-action transmit
Device(config-pmap-c-police)# exceed-action set-dscp-transmit dscp table exceed-markdown-table
Device(config-pmap-c-police)# violate-action set-dscp-transmit dscp table
violate-markdown-table
Device(config-pmap-c-police)# exit
Device(config-pmap-c)#
```

In this example, the exceed-markdown-table and violate-mark-down-table are table maps.

**Note** Policer based markdown actions are only supported using table maps. Only one markdown table map is allowed for each marking field in the device.

## Examples: Table Map Marking Configuration

The following steps and examples show how to use table map marking for your QoS configuration:

1. Define the table map.

Define the table-map using the **table-map** command and indicate the mapping of the values. This table does not know of the policies or classes within which it will be used. The default command in the table map indicates the value to be copied into the 'to' field when there is no matching 'from' field. In the example, a table map named `table-map1` is created. The mapping defined is to convert the value from 0 to 1 and from 2 to 3, while setting the default value to 4.

```
Device(config)# table-map table-map1
Device(config-tablemap)# map from 0 to 1
Device(config-tablemap)# map from 2 to 3
Device(config-tablemap)# default 4
Device(config-tablemap)# exit
```

2. Define the policy map where the table map will be used.

In the example, the incoming CoS is mapped to the DSCP based on the mapping specified in the table `table-map1`. For this example, if the incoming packet has a DSCP of 0, the CoS in the packet is set 1. If no table map name is specified the command assumes a default behavior where the value is copied as is from the 'from' field (DSCP in this case) to the 'to' field (CoS in this case). Note however, that while the CoS is a 3-bit field, the DSCP is a 6-bit field, which implies that the CoS is copied to the first three bits in the DSCP.

```
Device(config)# policy map policy1
Device(config-pmap)# class class-default
Device(config-pmap-c)# set cos dscp table table-map1
Device(config-pmap-c)# exit
```

3. Associate the policy to an interface.

```
Device(config)# interface GigabitEthernet1/0/1
Device(config-if)# service-policy output policy1
Device(config-if)# exit
```

## Example: Table Map Configuration to Retain CoS Markings

The following example shows how to use table maps to retain CoS markings on an interface for your QoS configuration.

The `cos-trust-policy` policy (configured in the example) is enabled in the ingress direction to retain the CoS marking coming into the interface. If the policy is not enabled, only the DSCP is trusted by default. If a pure Layer 2 packet arrives at the interface, then the CoS value will be rewritten to 0 when there is no such policy in the ingress port for CoS.

```
Device# configure terminal
Device(config)# table-map cos2cos
Device(config-tablemap)# default copy
Device(config-tablemap)# exit

Device(config)# policy map cos-trust-policy
Device(config-pmap)# class class-default
Device(config-pmap-c)# set cos cos table cos2cos
Device(config-pmap-c)# exit

Device(config)# interface GigabitEthernet1/0/2
Device(config-if)# service-policy input cos-trust-policy
Device(config-if)# exit
```

## Feature History and Information for QoS

| Release            | Modification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco IOS XE 3.3SE | This feature was introduced.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Cisco IOS XE 3.3SE | <p>Consistent system default trust behavior for both wired and wireless ports.</p> <p>The Cisco IOS XE 3.2 Release supported different trust defaults for wired and wireless ports. The trust default for wired ports was the same as for this software release. For wireless ports, the default system behavior was non-trust, which meant that when the came up, all markings for the wireless ports were defaulted to zero and no traffic received priority treatment. For compatibility with an existing wired , all traffic went to the best-effort queue by default. The access point performed priority queuing by default.</p> <p>The default trust behavior in the case of wireless ports could be changed by using the <b>no qos wireless default untrust</b> command.</p> |
| Cisco IOS XE 3.3SE | <p>Support for IPv6 wireless clients.</p> <p>The Cisco IOS XE 3.2 software release did not support IPv6 for wireless clients. This is now supported. Client policies can now have IPv4 and IPv6 filters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Cisco IOS XE 3.3SE | Support for 3 radios and 11ac.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring Radio Resource Management

The device should be configured as a mobility controller and not a mobility anchor to configure Radio Resource Management. It may require dynamic channel assignment functionality for the home APs to be supported.

The new mobility architecture that involves mobility controller and mobility agent must be configured on the switch or controllers for RRM to work.

---

**Note** Refer Mobility Configuration Guide for configuring mobility controller and mobility agent.

---

## Restrictions for Radio Resource Management

The number of APs in a RF-group is limited to 500.

If an AP tries to join the RF-group that already holds the maximum number of APs it can support, the device rejects the application and throws an error.

To enable Airtime Fairness mode for APs, you should disable enforce-policy mode and reapply it again. This will change the airtime fairness configuration for all the APs. You can also use the **ap name <ap-name> dot11 24ghz airtime-fairness mode enforce-policy** command to change airtime fairness mode for individual APs.

## Information About Radio Resource Management

The Radio Resource Management (RRM) software embedded in the device acts as a built-in RF engineer to consistently provide real-time RF management of your wireless network. RRM enables devices to continually monitor their associated lightweight access points for the following information:

- Traffic load—The total bandwidth used for transmitting and receiving traffic. It enables wireless LAN managers to track and plan network growth ahead of client demand.
- Interference—The amount of traffic coming from other 802.11 sources.
- Noise—The amount of non-802.11 traffic that is interfering with the currently assigned channel.
- Coverage—The Received Signal Strength (RSSI) and signal-to-noise ratio (SNR) for all connected clients.
- Other —The number of nearby access points.

RRM performs these functions:

- Radio resource monitoring
- Transmit power control
- Dynamic channel assignment
- Coverage hole detection and correction
- RF grouping

---

**Note**

RRM grouping will not happen, since AP operates in a static channel which is not in the DCA channel list. NDP is sent only on DCA channels and when radio operates on a non-DCA channel it will not receive NDA on-channel.

---

## Radio Resource Monitoring

RRM automatically detects and configures new devices and lightweight access points as they are added to the network. It then automatically adjusts associated and nearby lightweight access points to optimize coverage and capacity.

Lightweight access points can scan all valid channels for the country of operation as well as for channels available in other locations. The access points in local mode go “off-channel” for a period not greater than 60 ms to monitor these channels for noise and interference. Packets collected during this time are analyzed to detect rogue access points, rogue clients, ad-hoc clients, and interfering access points.

---

**Note** In the presence of voice traffic or other critical traffic (in the last 100 ms), the access points can defer off-channel measurements. It also defers based on WLAN scan defer priority configurations.

---

Each access point spends only 0.2 percent of its time off-channel. This activity is distributed across all access points so that adjacent access points are not scanning at the same time, which could adversely affect wireless LAN performance.

RRM supports new mobility architecture for RF grouping that involves Mobility Controller (MC) and Mobility Agent (MA).

- Mobility Controller (MC)—The Cisco WLC 5700 Series Controllers, Cisco Catalyst 3850 Switch, or Cisco Unified Wireless Networking Solution controller can act as MC. The MC has MC functionality and MA functionality that is running internally into it.
- Mobility Agent (MA)—The Mobility Agent is the component that maintains client mobility state machine for a mobile client.

## Information About RF Groups

An RF group is a logical collection of Cisco WLCs that coordinate to perform RRM in a globally optimized manner to perform network calculations on a per-radio basis. An RF group exists for each 802.11 network type. Clustering Cisco WLCs into a single RF group enable the RRM algorithms to scale beyond the capabilities of a single Cisco WLC.

RF group is created based on following parameters:

- User-configured RF network name.
- Neighbor discovery performed at the radio level.
- Country list configured on MC.

RF grouping runs between MCs.

Lightweight access points periodically send out neighbor messages over the air. Access points using the same RF group name validate messages from each other.

When access points on different Cisco WLCs hear validated neighbor messages at a signal strength of –80 dBm or stronger, the Cisco WLCs dynamically form an RF neighborhood in auto mode. In static mode, the leader is manually selected and the members are added to the RF Group. To know more about RF Group modes, [RF Group Leader](#).

---

**Note** RF groups and mobility groups are similar in that they both define clusters of Cisco WLCs, but they are different in terms of their use. An RF group facilitates scalable, system-wide dynamic RF management while a mobility group facilitates scalable, system-wide mobility and Cisco WLC redundancy.

---

## RF Group Leader

Starting in the 7.0.116.0 release, the RF Group Leader can be configured in two ways as follows:

- **Auto Mode**—In this mode, the members of an RF group elect an RF group leader to maintain a “master” power and channel scheme for the group. The RF grouping algorithm dynamically chooses the RF group leader and ensures that an RF group leader is always present. Group leader assignments can and do change (for instance, if the current RF group leader becomes inoperable or if RF group members experience major changes).
- **Static Mode**—In this mode, the user selects a Cisco WLC as an RF group leader manually. In this mode, the leader and the members are manually configured and are therefore fixed. If the members are unable to join the RF group, the reason is indicated. The leader tries to establish a connection with a member every 1 minute if the member has not joined in the previous attempt.

The RF group leader analyzes real-time radio data collected by the system, calculates the power and channel assignments, and sends them to each of the Cisco WLCs in the RF group. The RRM algorithms ensure system-wide stability and restrain channel and power scheme changes to the appropriate local RF neighborhoods.

In Cisco WLC software releases prior to 6.0, the dynamic channel assignment (DCA) search algorithm attempts to find a good channel plan for the radios associated to Cisco WLCs in the RF group, but it does not adopt a new channel plan unless it is considerably better than the current plan. The channel metric of the worst radio in both plans determines which plan is adopted. Using the worst-performing radio as the single criterion for adopting a new channel plan can result in pinning or cascading problems.

Pinning occurs when the algorithm could find a better channel plan for some of the radios in an RF group but is prevented from pursuing such a channel plan change because the worst radio in the network does not have any better channel options. The worst radio in the RF group could potentially prevent other radios in the group from seeking better channel plans. The larger the network, the more likely pinning becomes.

Cascading occurs when one radio’s channel change results in successive channel changes to optimize the remaining radios in the RF neighborhood. Optimizing these radios could lead to their neighbors and their neighbors’ neighbors having a suboptimal channel plan and triggering their channel optimization. This effect could propagate across multiple floors or even multiple buildings, if all the access point radios belong to the same RF group. This change results in considerable client confusion and network instability.

The main cause of both pinning and cascading is the way in which the search for a new channel plan is performed and that any potential channel plan changes are controlled by the RF circumstances of a single radio. In Cisco WLC software release 6.0, the DCA algorithm has been redesigned to prevent both pinning and cascading. The following changes have been implemented:

- **Multiple local searches**—The DCA search algorithm performs multiple local searches initiated by different radios within the same DCA run rather than performing a single global search driven by a single radio. This change addresses both pinning and cascading while maintaining the desired flexibility and adaptability of DCA and without jeopardizing stability.

- Multiple channel plan change initiators (CPCIs)—Previously, the single worst radio was the sole initiator of a channel plan change. Now each radio within the RF group is evaluated and prioritized as a potential initiator. Intelligent randomization of the resulting list ensures that every radio is eventually evaluated, which eliminates the potential for pinning.
- Limiting the propagation of channel plan changes (Localization)—For each CPCI radio, the DCA algorithm performs a local search for a better channel plan, but only the CPCI radio itself and its one-hop neighboring access points are actually allowed to change their current transmit channels. The impact of an access point triggering a channel plan change is felt only to within two RF hops from that access point, and the actual channel plan changes are confined to within a one-hop RF neighborhood. Because this limitation applies across all CPCI radios, cascading cannot occur.
- Non-RSSI-based cumulative cost metric—A cumulative cost metric measures how well an entire region, neighborhood, or network performs with respect to a given channel plan. The individual cost metrics of all access points in that area are considered in order to provide an overall understanding of the channel plan's quality. These metrics ensure that the improvement or deterioration of each single radio is factored into any channel plan change. The objective is to prevent channel plan changes in which a single radio improves but at the expense of multiple other radios experiencing a considerable performance decline.

The RRM algorithms run at a specified updated interval, which is 600 seconds by default. Between update intervals, the RF group leader sends keepalive messages to each of the RF group members and collects real-time RF data.

---

**Note** Several monitoring intervals are also available. See the Configuring RRM section for details.

---

## RF Group Name

A Cisco WLC is configured with an RF group name, which is sent to all access points joined to the Cisco WLC and used by the access points as the shared secret for generating the hashed MIC in the neighbor messages. To create an RF group, you configure all of the Cisco WLCs to be included in the group with the same RF group name.

If there is any possibility that an access point joined to a Cisco WLC may hear RF transmissions from an access point on a different Cisco WLC, you should configure the Cisco WLCs with the same RF group name. If RF transmissions between access points can be heard, then system-wide RRM is recommended to avoid 802.11 interference and contention as much as possible.

## Mobility Controller

An MC can either be a group leader or a group member. One of the MCs can act as a RF group leader based on RF grouping and RF group election with other MCs. The order of priority to elect the RF leader is based on the maximum number of APs the controller or switch can support. The highest priority being 1 and the least being 5.

1. WiSM 2 Controllers
2. Cisco WLC 5700 Series Controllers
3. WiSM 1 Controllers
4. Catalyst 3850 Series Switches
5. Catalyst 3650 Series Switches

When one of the MCs becomes the RRM group leader, the remaining MCs become RRM group members. RRM group members send their RF information to the Group Leader. The group leader determines a channel and Tx power plan for the network and passes the information back to the RF group members. The MCs push the power plan to MA for the radios that belong to MA. These channel and power plans are ultimately pushed down to individual radios.

---

**Note** MC has MA functionality within it.

---

## Mobility Agent

The MA communicates with the MC. The MC includes MAC or IP address of the switch/controller while communicating with the MA.

The MA provides the following information when polled by the MC:

- Interference or noise data.
- Neighbor data.
- Radio capabilities (supported channels, power levels).
- Radio configuration (power, channel, channel width).
- Radar data.

The MC exchanges the following information with the switch/controller (MA). The message includes:

- Configurations (channel/power/channel width) for individual radios.
- Polling requests for current configurations and RF measurements for individual radios
- Group Leader Update

In turn, the MA communicates the following messages with the MC:

- RF measurements from radios (e.g. load, noise and neighbor information)
- RF capabilities and configurations of individual radios

The MA sets channel, power, and channel width on the radios when directed by the MC. The DFS, coverage hole detection/mitigation, static channel/power configurations are performed by the MA.

## Information About Rogue Access Point Detection in RF Groups

After you have created an RF group of Cisco WLCs, you need to configure the access points connected to the Cisco WLCs to detect rogue access points. The access points will then select the beacon/probe-response frames in neighboring access point messages to see if they contain an authentication information element (IE) that matches that of the RF group. If the select is successful, the frames are authenticated. Otherwise, the authorized access point reports the neighboring access point as a rogue, records its BSSID in a rogue table, and sends the table to the Cisco WLC.

## Transmit Power Control

The device dynamically controls access point transmit power based on real-time wireless LAN conditions.

The Transmit Power Control (TPC) algorithm both increases and decreases an access point's power in response to changes in the RF environment. In most instances, TPC seeks to lower an access point's power to reduce interference, but in the case of a sudden change in the RF coverage—for example, if an access point fails or becomes disabled—TPC can also increase power on surrounding access points. This feature is different from coverage hole detection, which is primarily concerned with clients. TPC provides enough RF power to achieve desired coverage levels while avoiding channel interference between access points.

## Overriding the TPC Algorithm with Minimum and Maximum Transmit Power Settings

The TPC algorithm balances RF power in many diverse RF environments. However, it is possible that automatic power control will not be able to resolve some scenarios in which an adequate RF design was not possible to implement due to architectural restrictions or site restrictions—for example, when all access points must be mounted in a central hallway, placing the access points close together, but requiring coverage out to the edge of the building.

In these scenarios, you can configure maximum and minimum transmit power limits to override TPC recommendations. The maximum and minimum TPC power settings apply to all access points through RF profiles in a RF network.

To set the Maximum Power Level Assignment and Minimum Power Level Assignment, enter the maximum and minimum transmit power used by RRM in the text boxes in the Tx Power Control page. The range for these parameters is -10 to 30 dBm. The minimum value cannot be greater than the maximum value; the maximum value cannot be less than the minimum value.

If you configure a maximum transmit power, RRM does not allow any access point attached to the device to exceed this transmit power level (whether the power is set by RRM TPC or by coverage hole detection). For example, if you configure a maximum transmit power of 11 dBm, then no access point would transmit above 11 dBm, unless the access point is configured manually.

## Dynamic Channel Assignment

Two adjacent access points on the same channel can cause either signal contention or signal collision. In a collision, data is not received by the access point. This functionality can become a problem, for example, when someone reading e-mail in a café affects the performance of the access point in a neighboring business. Even though these are completely separate networks, someone sending traffic to the café on channel 1 can disrupt communication in an enterprise using the same channel. Devices can dynamically allocate access point channel assignments to avoid conflict and to increase capacity and performance. Channels are “reused” to avoid wasting scarce RF resources. In other words, channel 1 is allocated to a different access point far from the café, which is more effective than not using channel 1 altogether.

The device's Dynamic Channel Assignment (DCA) capabilities are also useful in minimizing adjacent channel interference between access points. For example, two overlapping channels in the 802.11b/g band, such as 1 and 2, cannot both simultaneously use 11/54 Mbps. By effectively reassigning channels, the device keeps adjacent channels separated.

---

**Note** We recommend that you use only non-overlapping channels (1, 6, 11, and so on).

---

The device examines a variety of real-time RF characteristics to efficiently handle channel assignments as follows:

- Access point received energy—The received signal strength measured between each access point and its nearby neighboring access points. Channels are optimized for the highest network capacity.
- Noise—Noise can limit signal quality at the client and access point. An increase in noise reduces the effective cell size and degrades user experience. By optimizing channels to avoid noise sources, the device can optimize coverage while maintaining system capacity. If a channel is unusable due to excessive noise, that channel can be avoided.
- 802.11 Interference—Interference is any 802.11 traffic that is not part of your wireless LAN, including rogue access points and neighboring wireless networks. Lightweight access points constantly scan all channels looking for sources of interference. If the amount of 802.11 interference exceeds a predefined configurable threshold (the default is 10 percent), the access point sends an alert to the device. Using the RRM algorithms, the device may then dynamically rearrange channel assignments to increase system performance in the presence of the interference. Such an adjustment could result in adjacent lightweight access points being on the same channel, but this setup is preferable to having the access points remain on a channel that is unusable due to an interfering foreign access point.

In addition, if other wireless networks are present, the device shifts the usage of channels to complement the other networks. For example, if one network is on channel 6, an adjacent wireless LAN is assigned to channel 1 or 11. This arrangement increases the capacity of the network by limiting the sharing of frequencies. If a channel has virtually no capacity remaining, the device may choose to avoid this channel. In very dense deployments in which all nonoverlapping channels are occupied, the device does its best, but you must consider RF density when setting expectations.

- Load and utilization—When utilization monitoring is enabled, capacity calculations can consider that some access points are deployed in ways that carry more traffic than other access points (for example, a lobby versus an engineering area). The device can then assign channels to improve the access point with the worst performance reported. The load is taken into account when changing the channel structure to minimize the impact on clients currently in the wireless LAN. This metric keeps track of every access point's transmitted and received packet counts to determine how busy the access points are. New clients avoid an overloaded access point and associate to a new access point. This parameter is disabled by default.

The device combines this RF characteristic information with RRM algorithms to make system-wide decisions. Conflicting demands are resolved using soft-decision metrics that guarantee the best choice for minimizing network interference. The end result is optimal channel configuration in a three-dimensional space, where access points on the floor above and below play a major factor in an overall wireless LAN configuration.

---

**Note** Radios using 40-MHz channels in the 2.4-GHz band or 80MHz channels are not supported by DCA.

---

The RRM startup mode is invoked in the following conditions:

- In a single-device environment, the RRM startup mode is invoked after the device is upgraded and rebooted.

- In a multiple-device environment, the RRM startup mode is invoked after an RF Group leader is elected.

You can trigger RRM startup mode from CLI.

RRM startup mode runs for 100 minutes (10 iterations at 10-minute intervals). The duration of the RRM startup mode is independent of the DCA interval, sensitivity, and network size. The startup mode consists of 10 DCA runs with high sensitivity (making channel changes easy and sensitive to the environment) to converge to a steady state channel plan. After the startup mode is finished, DCA continues to run at the specified interval and sensitivity.

---

**Note** DCA algorithm interval is set to one hour, but DCA algorithm always runs in default interval of 10min, channel allocation happens for every 10min interval for the first 10 cycles, and channel changes as per DCA algorithm for every 10min. After that it goes back to the configured time interval. This is common for both DCA interval and Anchor time since it follows the steady state.

---

---

**Note** If DCA/TPC is turned off on the RF-group member, and auto is set on RF-group leader, the channel/TX power on member gets changed as per the algorithm run on the RF-group leader.

---

## Coverage Hole Detection and Correction

The RRM coverage hole detection algorithm can detect areas of radio coverage in a wireless LAN that are below the level needed for robust radio performance. This feature can alert you to the need for an additional (or relocated) lightweight access point.

If clients on a lightweight access point are detected at threshold levels (RSSI, failed client count, percentage of failed packets, and number of failed packets) lower than those specified in the RRM configuration, the access point sends a “coverage hole” alert to the device. The alert indicates the existence of an area where clients are continually experiencing poor signal coverage, without having a viable access point to which to roam. The device discriminates between coverage holes that can and cannot be corrected. For coverage holes that can be corrected, the device mitigates the coverage hole by increasing the transmit power level for that specific access point. The device does not mitigate coverage holes caused by clients that are unable to increase their transmit power or are statically set to a power level because increasing their downstream transmit power might increase interference in the network.

## How to Configure RRM

### Configuring Advanced RRM CCX Parameters (CLI)

#### SUMMARY STEPS

1. **configure terminal**
2. **ap dot11 24ghz | 5ghz rrm ccx location-measurement *interval***
3. **end**

| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                                                                                    | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                                                                                                                                                                                                   |

## Configuring RF Groups

This section describes how to configure RF groups through either the GUI or the CLI.

**Note** The RF group name is generally set at deployment time through the Startup Wizard. However, you can change it as necessary.

**Note** When the multiple-country feature is being used, all Cisco WLCs intended to join the same RF group must be configured with the same set of countries, configured in the same order.

**Note** You can also configure RF groups using the Cisco Prime Infrastructure.

**Note** In Auto mode, RF group leader will skip TPC and DCA for first three runs of grouping cycle in order to stabilize the RF-group

## Configuring RF Group Selection Mode (CLI)

### SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 24ghz | 5ghz rrm group-mode {auto | leader | off}`
3. `end`

### DETAILED STEPS

|        | Command or Action                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                     |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                           |
| Step 2 | <b>ap dot11 24ghz   5ghz rrm group-mode {auto   leader   off}</b><br><b>Example:</b><br>Device (config)# <code>ap dot11 24ghz rrm group-mode leader</code> | Configures RF group selection mode for 802.11 bands. <ul style="list-style-type: none"> <li>• <b>auto</b>—Sets the 802.11 RF group selection to automatic update mode.</li> <li>• <b>leader</b>—Sets the 802.11 RF group selection to leader mode.</li> <li>• <b>off</b>—Disables the 802.11 RF group selection.</li> </ul> |
| Step 3 | <b>end</b><br><b>Example:</b>                                                                                                                              | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                                                                                                                                                                                         |

|  | Command or Action            | Purpose |
|--|------------------------------|---------|
|  | Device (config) # <b>end</b> |         |

## Configuring an RF Group Name (CLI)

### SUMMARY STEPS

1. **configure terminal**
2. **wireless rf-network** *name*
3. **end**
4. **show network profile** *profile\_number*

### DETAILED STEPS

|               | Command or Action                                                                                                  | Purpose                                                                                                                                                                                                      |
|---------------|--------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><br><b>Example:</b><br>Device# <b>configure terminal</b>                              | Enters global configuration mode.                                                                                                                                                                            |
| <b>Step 2</b> | <b>wireless rf-network</b> <i>name</i><br><br><b>Example:</b><br>Device (config)# <b>wireless rf-network test1</b> | Creates an RF group. The group name should be ASCII String up to 19 characters and is case sensitive.<br><br><b>Note</b> Repeat this procedure for each controller that you want to include in the RF group. |
| <b>Step 3</b> | <b>end</b><br><br><b>Example:</b><br>Device (config) # <b>end</b>                                                  | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                                                                          |
| <b>Step 4</b> | <b>show network profile</b> <i>profile_number</i>                                                                  | Displays the RF group.<br><br><b>Note</b> You can view the network profile number from 1 to 4294967295.                                                                                                      |

## Configuring Members in a 802.11 Static RF Group (CLI)

### SUMMARY STEPS

1. **configure terminal**
2. **ap dot11 24ghz | 5ghz rrm group-member** *group\_name ip\_addr*
3. **end**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                   | Purpose                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                             | Enters global configuration mode.                                                                                         |
| Step 2 | <b>ap dot11 24ghz   5ghz rrm group-member <i>group_name</i> <i>ip_addr</i></b><br><b>Example:</b><br>Device(config)# <code>ap dot11 24ghz rrm group-member Grpmem01 10.1.1.1</code> | Configures members in a 802.11 static RF group. The group mode should be set as leader for the group member to be active. |
| Step 3 | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                                   | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.       |

## Configuring Transmit Power Control

### Configuring the Tx-Power Control Threshold (CLI)

## SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 24ghz | 5ghz rrm tpc-threshold threshold_value`
3. `end`

## DETAILED STEPS

|        | Command or Action                                                                                                                                             | Purpose                                                                                                             |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                       | Enters global configuration mode.                                                                                   |
| Step 2 | <b>ap dot11 24ghz   5ghz rrm tpc-threshold <i>threshold_value</i></b><br><b>Example:</b><br>Device(config)# <code>ap dot11 24ghz rrm tpc-threshold -60</code> | Configures the Tx-power control threshold used by RRM for auto power assignment. The range is from $-80$ to $-50$ . |
| Step 3 | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                             | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Configuring the Tx-Power Level (CLI)

### SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 24ghz | 5ghz rrm txpower {trans_power_level | auto | max | min | once}`
3. `end`

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                 |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                       |
| Step 2 | <b>ap dot11 24ghz   5ghz rrm txpower {<i>trans_power_level</i>   <b>auto</b>   <b>max</b>   <b>min</b>   <b>once</b>}</b><br><b>Example:</b><br>Device(config)# <code>ap dot11 24ghz rrm txpower auto</code> | Configures the 802.11 tx-power level <ul style="list-style-type: none"> <li>• <b>trans_power_level</b>—Sets the transmit power level.</li> <li>• <b>auto</b>—Enables auto-RF.</li> <li>• <b>max</b>—Configures the maximum auto-RF tx-power.</li> <li>• <b>min</b>—Configures the minimum auto-RF tx-power.</li> <li>• <b>once</b>—Enables one-time auto-RF.</li> </ul> |
| Step 3 | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                                                            | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                                                                                                                                                                                                                                     |

## Configuring 802.11 RRM Parameters

### Configuring Advanced 802.11 Channel Assignment Parameters (CLI)

#### SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 {24ghz | 5ghz} rrm channel cleanair-event sensitivity {high | low | medium}`
3. `ap dot11 {24ghz | 5ghz} rrm channel dca {channel number | anchor-time | global {auto | once} | interval | min-metric | sensitivity {high | low | medium}}`
4. `ap dot11 5ghz rrm channel dca chan-width {20 | 40 | 80 | best}`
5. `ap dot11 {24ghz | 5ghz} rrm channel device`
6. `ap dot11 {24ghz | 5ghz} rrm channel foreign`
7. `ap dot11 {24ghz | 5ghz} rrm channel load`
8. `ap dot11 {24ghz | 5ghz} rrm channel noise`
9. `end`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                       | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 2 | <b>ap dot11 {24ghz   5ghz} rrm channel cleanair-event sensitivity {high   low   medium}</b><br><b>Example:</b><br>Device(config)# <b>ap dot11 24ghz rrm channel cleanair-event sensitivity high</b>                                                     | Configures CleanAir event-driven RRM parameters. <ul style="list-style-type: none"> <li>• <b>High</b>—Specifies the most sensitivity to non-Wi-Fi interference as indicated by the air quality (AQ) value.</li> <li>• <b>Low</b>—Specifies the least sensitivity to non-Wi-Fi interference as indicated by the AQ value.</li> <li>• <b>Medium</b>—Specifies medium sensitivity to non-Wi-Fi interference as indicated by the AQ value.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 3 | <b>ap dot11 {24ghz   5ghz} rrm channel dca {channel number   anchor-time   global {auto   once}   interval   min-metric   sensitivity {high   low   medium}}</b><br><b>Example:</b><br>Device(config)# <b>ap dot11 24ghz rrm channel dca interval 2</b> | Configures Dynamic Channel Assignment (DCA) algorithm parameters for the 802.11 band. <ul style="list-style-type: none"> <li>• <b>&lt;I-14&gt;</b>—Enter a channel number to be added to the DCA list.</li> <li>• <b>anchor-time</b>—Configures the anchor time for the DCA. The range is between 0 and 23 hours.</li> <li>• <b>global</b>—Configures the DCA mode for all 802.11 Cisco APs.               <ul style="list-style-type: none"> <li>• <b>auto</b>—Enables auto-RF.</li> <li>• <b>once</b>—Enables auto-RF only once.</li> </ul> </li> <li>• <b>interval</b>—Configures the DCA interval value. The values are 1, 2, 3, 4, 6, 8, 12 and 24 hours and the default value 0 denotes 10 minutes.</li> <li>• <b>min-metric</b>—Configures the DCA minimum RSSI energy metric. The range is between -100 and -60.</li> <li>• <b>sensitivity</b>—Configures the DCA sensitivity level to changes in the environment.               <ul style="list-style-type: none"> <li>• <b>high</b>—Specifies the most sensitivity.</li> <li>• <b>low</b>—Specifies the least sensitivity.</li> <li>• <b>medium</b>—Specifies medium sensitivity.</li> </ul> </li> </ul> |
| Step 4 | <b>ap dot11 5ghz rrm channel dca chan-width {20   40   80   best}</b>                                                                                                                                                                                   | Configures the DCA channel width for all 802.11 radios in the 5-GHz band. Sets the channel width to 20 MHz, 40 MHz, 80 MHz, or Best; 20 MHz is the default value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|               | Command or Action                                                                                                                  | Purpose                                                                                                             |
|---------------|------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>ap dot11 {24ghz   5ghz} rrm channel device</b><br><b>Example:</b><br>Device(config)# <b>ap dot11 24ghz rrm channel device</b>   | Configures the persistent non-Wi-Fi device avoidance in the 802.11 channel assignment.                              |
| <b>Step 6</b> | <b>ap dot11 {24ghz   5ghz} rrm channel foreign</b><br><b>Example:</b><br>Device(config)# <b>ap dot11 24ghz rrm channel foreign</b> | Configures the foreign AP 802.11 interference avoidance in the channel assignment.                                  |
| <b>Step 7</b> | <b>ap dot11 {24ghz   5ghz} rrm channel load</b><br><b>Example:</b><br>Device(config)# <b>ap dot11 24ghz rrm channel load</b>       | Configures the Cisco AP 802.11 load avoidance in the channel assignment.                                            |
| <b>Step 8</b> | <b>ap dot11 {24ghz   5ghz} rrm channel noise</b><br><b>Example:</b><br>Device(config)# <b>ap dot11 24ghz rrm channel noise</b>     | Configures the 802.11 noise avoidance in the channel assignment.                                                    |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                        | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Configuring 802.11 Coverage Hole Detection (CLI)

### SUMMARY STEPS

1. configure terminal
2. ap dot11 24ghz | 5ghz rrm coverage data {fail-percentage | packet-count | rssi-threshold}
3. ap dot11 24ghz | 5ghz rrm coverage exception global *exception level*
4. ap dot11 24ghz | 5ghz rrm coverage level global *cli\_min exception level*
5. ap dot11 24ghz | 5ghz rrm coverage voice {fail-percentage | packet-count | rssi-threshold}
6. end

### DETAILED STEPS

|               | Command or Action                                                                 | Purpose                           |
|---------------|-----------------------------------------------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters global configuration mode. |

|        | Command or Action                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Configuring 802.11 Statistics Monitoring (CLI)

### SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 24ghz | 5ghz rrm monitor channel-list {all | country | dca}`
3. `ap dot11 24ghz | 5ghz rrm monitor coverage interval`
4. `ap dot11 24ghz | 5ghz rrm monitor load interval`

5. `ap dot11 24ghz | 5ghz rrm monitor noise interval`
6. `ap dot11 24ghz | 5ghz rrm monitor signal interval`
7. `end`

## DETAILED STEPS

|        | Command or Action                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                  |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                                                        |
| Step 2 | <b>ap dot11 24ghz   5ghz rrm monitor channel-list {all   country   dca}</b><br><b>Example:</b><br><pre>Device(config)# ap dot11 24ghz rrm monitor channel-list all</pre> | Sets the 802.11 monitoring channel-list for parameters such as noise/interference/rogue. <ul style="list-style-type: none"> <li>• <b>all</b>— Monitors all channels.</li> <li>• <b>country</b>— Monitor channels used in configured country code.</li> <li>• <b>dca</b>— Monitor channels used by dynamic channel assignment.</li> </ul> |
| Step 3 | <b>ap dot11 24ghz   5ghz rrm monitor coverage interval</b><br><b>Example:</b><br><pre>Device(config)# ap dot11 24ghz rrm monitor coverage 600</pre>                      | Configures the 802.11 coverage measurement interval in seconds that ranges from 60 to 3600.                                                                                                                                                                                                                                              |
| Step 4 | <b>ap dot11 24ghz   5ghz rrm monitor load interval</b><br><b>Example:</b><br><pre>Device(config)# ap dot11 24ghz rrm monitor load 180</pre>                              | Configures the 802.11 load measurement interval in seconds that ranges from 60 to 3600.                                                                                                                                                                                                                                                  |
| Step 5 | <b>ap dot11 24ghz   5ghz rrm monitor noise interval</b><br><b>Example:</b><br><pre>Device(config)# ap dot11 24ghz rrm monitor noise 360</pre>                            | Configures the 802.11 noise measurement interval (channel scan interval) in seconds that ranges from 60 to 3600.                                                                                                                                                                                                                         |
| Step 6 | <b>ap dot11 24ghz   5ghz rrm monitor signal interval</b><br><b>Example:</b><br><pre>Device(config)# ap dot11 24ghz rrm monitor signal 480</pre>                          | Configures the 802.11 signal measurement interval (neighbor packet frequency) in seconds that ranges from 60 to 3600.                                                                                                                                                                                                                    |
| Step 7 | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                                                                          | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                                                                                                                                                                                                      |

## Configuring the 802.11 Performance Profile (CLI)

### SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 24ghz | 5ghz rrm profile clients cli_threshold_value`
3. `ap dot11 24ghz | 5ghz rrm profile foreign int_threshold_value`
4. `ap dot11 24ghz | 5ghz rrm profile noise for_noise_threshold_value`
5. `ap dot11 24ghz | 5ghz rrm profile throughput throughput_threshold_value`
6. `ap dot11 24ghz | 5ghz rrm profile utilization rf_util_threshold_value`
7. `end`

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                   | Purpose                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <code>configure terminal</code><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                       | Enters global configuration mode.                                                                               |
| <b>Step 2</b> | <code>ap dot11 24ghz   5ghz rrm profile clients cli_threshold_value</code><br><b>Example:</b><br>Device(config)# <code>ap dot11 24ghz rrm profile clients 20</code>                 | Sets the threshold value for 802.11 Cisco AP clients that range between 1 and 75 clients.                       |
| <b>Step 3</b> | <code>ap dot11 24ghz   5ghz rrm profile foreign int_threshold_value</code><br><b>Example:</b><br>Device(config)# <code>ap dot11 24ghz rrm profile foreign 50</code>                 | Sets the threshold value for 802.11 foreign interference that ranges between 0 and 100%.                        |
| <b>Step 4</b> | <code>ap dot11 24ghz   5ghz rrm profile noise for_noise_threshold_value</code><br><b>Example:</b><br>Device(config)# <code>ap dot11 24ghz rrm profile noise -65</code>              | Sets the threshold value for 802.11 foreign noise ranges between -127 and 0 dBm.                                |
| <b>Step 5</b> | <code>ap dot11 24ghz   5ghz rrm profile throughput throughput_threshold_value</code><br><b>Example:</b><br>Device(config)# <code>ap dot11 24ghz rrm profile throughput 10000</code> | Sets the threshold value for 802.11 Cisco AP throughput that ranges between 1000 and 10000000 bytes per second. |

|        | Command or Action                                                                                                                                                                               | Purpose                                                                                                             |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 6 | <b>ap dot11 24ghz   5ghz rrm profile utilization</b><br><i>rf_util_threshold_value</i><br><br><b>Example:</b><br><br>Device(config)# <b>ap dot11 24ghz rrm profile</b><br><b>utilization 75</b> | Sets the threshold value for 802.11 RF utilization that ranges between 0 to 100%.                                   |
| Step 7 | <b>end</b><br><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                                                                                             | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode. |

## Configuring Rogue Access Point Detection in RF Groups

### Configuring Rogue Access Point Detection in RF Groups (CLI)

#### Before you begin

Ensure that each Cisco WLC in the RF group has been configured with the same RF group name.

**Note** The name is used to verify the authentication IE in all beacon frames. If the Cisco WLCs have different names, false alarms will occur.

#### SUMMARY STEPS

1. **ap name** *Cisco\_AP* **mode** {**local** | **monitor**}
2. **end**
3. **configure terminal**
4. **wireless wps ap-authentication**
5. **wireless wps ap-authentication threshold** *value*

#### DETAILED STEPS

|        | Command or Action                                                            | Purpose                                                                                                                                                          |
|--------|------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>ap name</b> <i>Cisco_AP</i> <b>mode</b> { <b>local</b>   <b>monitor</b> } | Configures a particular access point for local (normal) mode or monitor (listen-only) mode. Perform this step for every access point connected to the Cisco WLC. |
|        | <b>Example:</b><br><br>Device# <b>ap name ap1 mode local</b>                 |                                                                                                                                                                  |
| Step 2 | <b>end</b><br><br><b>Example:</b><br><br>Device(config)# <b>end</b>          | Returns to privileged EXEC mode. Alternatively, you can also press <b>Ctrl-Z</b> to exit global configuration mode.                                              |

|               | Command or Action                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 4</b> | <b>wireless wps ap-authentication</b><br><b>Example:</b><br>Device (config)# <code>wireless wps ap-authentication</code>                                     | Enables rogue access point detection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 5</b> | <b>wireless wps ap-authentication threshold <i>value</i></b><br><b>Example:</b><br>Device (config)# <code>wireless wps ap-authentication threshold 50</code> | <p>Specifies when a rogue access point alarm is generated. An alarm occurs when the threshold value (which specifies the number of access point frames with an invalid authentication IE) is met or exceeded within the detection period.</p> <p>The valid threshold range is from 1 to 255, and the default threshold value is 1. To avoid false alarms, you may want to set the threshold to a higher value.</p> <p><b>Note</b> Enable rogue access point detection and threshold value on every Cisco WLC in the RF group.</p> <p><b>Note</b> If rogue access point detection is not enabled on every Cisco WLC in the RF group, the access points on the Cisco WLCs with this feature disabled are reported as rogues.</p> |

## Monitoring RRM Parameters and RF Group Status

### Monitoring RRM Parameters

*Table 98: Commands for monitoring Radio Resource Management*

| Commands                                  | Description                                                                  |
|-------------------------------------------|------------------------------------------------------------------------------|
| <code>show ap dot11 24ghz ccx</code>      | Displays the 802.11b CCX information for all Cisco APs.                      |
| <code>show ap dot11 24ghz channel</code>  | Displays the configuration and statistics of the 802.11b channel assignment. |
| <code>show ap dot11 24ghz coverage</code> | Displays the configuration and statistics of the 802.11b coverage.           |
| <code>show ap dot11 24ghz group</code>    | Displays the configuration and statistics of the 802.11b grouping.           |
| <code>show ap dot11 24ghz l2roam</code>   | Displays 802.11b l2roam information.                                         |
| <code>show ap dot11 24ghz logging</code>  | Displays the configuration and statistics of the 802.11b event logging.      |
| <code>show ap dot11 24ghz monitor</code>  | Displays the configuration and statistics of the 802.11b monitoring.         |

| Commands                     | Description                                                                      |
|------------------------------|----------------------------------------------------------------------------------|
| show ap dot11 24ghz profile  | Displays 802.11b profiling information for all Cisco APs.                        |
| show ap dot11 24ghz receiver | Displays the configuration and statistics of the 802.11b receiver.               |
| show ap dot11 24ghz summary  | Displays the configuration and statistics of the 802.11b Cisco APs.              |
| show ap dot11 24ghz txpower  | Displays the configuration and statistics of the 802.11b transmit power control. |
| show ap dot11 5ghz ccx       | Displays 802.11a CCX information for all Cisco APs.                              |
| show ap dot11 5ghz channel   | Displays the configuration and statistics of the 802.11a channel assignment.     |
| show ap dot11 5ghz coverage  | Displays the configuration and statistics of the 802.11a coverage.               |
| show ap dot11 5ghz group     | Displays the configuration and statistics of the 802.11a grouping.               |
| show ap dot11 5ghz l2roam    | Displays 802.11a l2roam information.                                             |
| show ap dot11 5ghz logging   | Displays the configuration and statistics of the 802.11a event logging.          |
| show ap dot11 5ghz monitor   | Displays the configuration and statistics of the 802.11a monitoring.             |
| show ap dot11 5ghz profile   | Displays 802.11a profiling information for all Cisco APs.                        |
| show ap dot11 5ghz receiver  | Displays the configuration and statistics of the 802.11a receiver.               |
| show ap dot11 5ghz summary   | Displays the configuration and statistics of the 802.11a Cisco APs.              |
| show ap dot11 5ghz txpower   | Displays the configuration and statistics of the 802.11a transmit power control. |

## Monitoring RF Group Status (CLI)

This section describes the new commands for RF group status.

The following commands can be used to monitor RF group status on the .

**Table 99: Monitoring Aggressive Load Balancing Command**

| Command                          | Purpose                                                                                |
|----------------------------------|----------------------------------------------------------------------------------------|
| <b>show ap dot11 5ghz group</b>  | Displays the Cisco WLC name which is the RF group leader for the 802.11a RF network.   |
| <b>show ap dot11 24ghz group</b> | Displays the Cisco WLC name which is the RF group leader for the 802.11b/g RF network. |

## Examples: RF Group Configuration

This example shows how to configure RF group name:

```
Device# configure terminal
Device(config)# wireless rf-network test1
Device(config)# ap dot11 24ghz shutdown
Device(config)# end
Device # show network profile 5
```

This example shows how to configure rogue access point detection in RF groups:

```
Device# ap name ap1 mode local
Device# end
Device# configure terminal
Device(config)# wireless wps ap-authentication
Device(config)# wireless wps ap-authentication threshold 50
Device(config)# end
```

## Information About ED-RRM

Spontaneous interference is interference that appears suddenly on a network, perhaps jamming a channel or a range of channels completely. The Cisco CleanAir spectrum event-driven RRM feature allows you to set a threshold for air quality (AQ) that, if exceeded, triggers an immediate channel change for the affected access point. Most RF management systems can avoid interference, but this information takes time to propagate through the system. Cisco CleanAir relies on AQ measurements to continuously evaluate the spectrum and can trigger a move within 30 seconds. For example, if an access point detects interference from a video camera, it can recover by changing channels within 30 seconds of the camera becoming active. Cisco CleanAir also identifies and locates the source of interference so that more permanent mitigation of the device can be performed at a later time.

## Configuring ED-RRM on the Cisco Wireless LAN Controller (CLI)

- Step 1** Trigger spectrum event-driven radio resource management (RRM) to run when a Cisco CleanAir-enabled access point detects a significant level of interference by entering these commands:
- ap dot11 {24ghz | 5ghz} rrm channel cleanair-event** —Configures CleanAir driven RRM parameters for the 802.11 Cisco lightweight access points.
- ap dot11 {24ghz | 5ghz} rrm channel cleanair-event sensitivity {low | medium | high | custom}**—Configures CleanAir driven RRM sensitivity for the 802.11 Cisco lightweight access points. Default selection is Medium.
- ap dot11 {24ghz | 5ghz} rrm channel cleanair-event rogue-contribution**—Enables rogue contribution.
- ap dot11 {24ghz | 5ghz} rrm channel cleanair-event rogue-contributionduty-cycle thresholdvalue**—Configures threshold value for rogue contribution. The valid range is from 1 to 99, with 80 as the default.
- Step 2** Save your changes by entering this command:
- write memory**

**Step 3** See the CleanAir configuration for the 802.11a/n/ac or 802.11b/g/n network by entering this command:

```
show ap dot11 {24ghz | 5ghz} cleanair config
```

Information similar to the following appears:

```
AdditionalClean Air Settings:
CleanAir Event-driven RRM State..... : Enabled
CleanAir Driven RRM Sensitivity..... : LOW
CleanAir Event-driven RRM Rogue Option..... : Enabled
CleanAir Event-driven RRM Rogue Duty Cycle... : 80
CleanAir Persistent Devices state..... : Disabled
CleanAir Persistent Device Propagation..... : Disabled
```

# Feature History and Information For Performing Radio Resource Management Configuration

| Release            | Feature Information          |
|--------------------|------------------------------|
| Cisco IOS XE 3.3SE | This feature was introduced. |

## CHAPTER 70

# Configuring Optimized Roaming

- [Information About Optimized Roaming, on page 1315](#)
- [Restrictions for Optimized Roaming, on page 1315](#)
- [Configuring Optimized Roaming \(CLI\), on page 1316](#)

## Information About Optimized Roaming

Optimized roaming resolves the problem of sticky clients that remain associated to access points that are far away and outbound clients that attempt to connect to a Wi-Fi network without having a stable connection. This feature disassociates clients based on the RSSI of the client data packets and data rate. The client is disassociated if the RSSI alarm condition is met and the current data rate of the client is lower than the optimized roaming data rate threshold. You can disable the data rate option so that only RSSI is used for disassociating clients.

Optimized roaming also prevents client association when the client's RSSI is low. This feature checks the RSSI of the incoming client against the RSSI threshold. This check prevents the clients from connecting to a Wi-Fi network unless the client has a viable connection. In many scenarios, even though clients can hear beacons and connect to a Wi-Fi network, the signal might not be strong enough to support a stable connection.

You can also configure the client coverage reporting interval for a radio by using optimized roaming. The client coverage statistics include data packet RSSIs, Coverage Hole Detection and Mitigation (CHDM) pre-alarm failures, retransmission requests, and current data rates.

Optimized Roaming is implemented in the following scenarios:

- Addresses the sticky client challenge by pro-actively disconnecting clients.
- Actively monitors Data RSSI packets.
- Disassociates client when the RSSI is lower than the set threshold.

## Restrictions for Optimized Roaming

- You cannot configure the optimized roaming interval until you disable the 802.11a/b network.

## Configuring Optimized Roaming (CLI)

---

**Step 1** Enable or disable optimized roaming by entering this command:

```
config advanced {802.11a | 802.11b} optimized-roaming {enable | disable}
```

By default, optimized roaming is disabled.

**Step 2** Configure the client coverage reporting interval for 802.11a/b networks by entering this command:

```
config advanced {802.11a | 802.11b} optimized-roaming interval seconds
```

The range is from 5 to 90 seconds. The default value is 90 seconds.

**Note** You must disable the 802.11a/b network before you configure the optimized roaming reporting interval.

**Step 3** Configure the threshold data rate for 802.11a/b networks by entering this command:

```
config advanced {802.11a | 802.11b} optimized-roaming datarate mbps
```

For 802.11a, the configurable data rates are 6, 9, 12, 18, 24, 36, 48, and 54. For 802.11b, the configurable data rates are 1, 2, 5.5, 11, 6, 9, 12, 18, 24, 36, 48, and 54. You can configure 0 to disable the data rate.

**Step 4** View information about optimized roaming for each band by entering this command:

```
show advanced {802.11a | 802.11b} optimized-roaming
```

```
(Cisco Controller) > show advanced 802.11a optimized-roaming
OptimizedRoaming
 802.11a OptimizedRoaming Mode..... Enabled
 802.11a OptimizedRoaming Reporting Interval.... 20 seconds
 802.11a OptimizedRoaming Rate Threshold..... disabled
```

**Step 5** View information about optimized roaming statistics by entering this command:

```
show advanced {802.11a | 802.11b} optimized-roaming stats
```

```
(Cisco Controller) > show advanced 802.11a optimized-roaming stats
OptimizedRoaming Stats
 802.11a OptimizedRoaming Disassociations..... 0
 802.11a OptimizedRoaming Rejections..... 0
```

---

## CHAPTER 71

# Configuring Rx SOP

---

- [Information About Rx-SOP, on page 1317](#)
- [Configuring Rx SOP \(CLI\), on page 1317](#)

## Information About Rx-SOP

Receiver Start of Packet Detection Threshold (Rx SOP) determines the Wi-Fi signal level in dBm at which an access point's radio demodulates and decodes a packet. As the Wi-Fi level increases, the radio sensitivity decreases and the receiver cell size becomes smaller. Reduction of the cell size affects the distribution of clients in the network.

Rx SOP is used to address clients with weak RF links, sticky clients, and client load balancing across access points. Rx SOP helps to optimize the network performance at high-density deployments such as stadiums and auditoriums where access points need to optimize the nearest and strongest clients.

## Configuring Rx SOP (CLI)

---

**Step 1** Configure the Rx SOP mode by entering this command:

```
ap dot11 {24ghz | 5ghz} rx-sop threshold {auto | high | low | medium}
```

**Step 2** Verify Rx SOP high-density parameters:

```
show ap dot11 24ghz high-density
```

```
Controller# show ap dot11 24ghz high-density
Receiver Start-of-Packet threshold: auto
Multicast Data Rate: auto
AP Name : AP5475.d064.0552
Receiver Start-of-Packet threshold: auto
Multicast Data Rate: auto 2:33 PM
```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring MSDP

This section describes how to configure the Multicast Source Discovery Protocol (MSDP) on the switch. The MSDP connects multiple Protocol-Independent Multicast sparse-mode (PIM-SM) domains.

MSDP is not fully supported in this software release because of a lack of support for Multicast Border Gateway Protocol (MBGP), which works closely with MSDP. However, it is possible to create default peers that MSDP can operate with if MBGP is not running.

---

**Note** To use this feature, the active switch must be running the IP services feature set.

---

## MSDP Overview

MSDP allows multicast sources for a group to be known to all rendezvous points (RPs) in different domains. Each PIM-SM domain uses its own RPs and does not depend on RPs in other domains. An RP runs MSDP over the Transmission Control Protocol (TCP) to discover multicast sources in other domains.

An RP in a PIM-SM domain has an MSDP peering relationship with MSDP-enabled devices in another domain. The peering relationship occurs over a TCP connection, primarily exchanging a list of sources sending to multicast groups. The TCP connections between RPs are achieved by the underlying routing system. The receiving RP uses the source lists to establish a source path.

The purpose of this topology is to have domains discover multicast sources in other domains. If the multicast sources are of interest to a domain that has receivers, multicast data is delivered over the normal, source-tree building mechanism in PIM-SM. MSDP is also used to announce sources sending to a group. These announcements must originate at the domain's RP.

MSDP depends heavily on the Border Gateway Protocol (BGP) or MBGP for interdomain operation. We recommend that you run MSDP in RPs in your domain that are RPs for sources sending to global groups to be announced to the Internet.

## MSDP Operation

When a source sends its first multicast packet, the first-hop router (*designated router* or RP) directly connected to the source sends a PIM register message to the RP. The RP uses the register message to register the active source and to forward the multicast packet down the shared tree in the local domain. With MSDP configured, the RP also forwards a source-active (SA) message to all MSDP peers. The SA message identifies the source, the group the source is sending to, and the address of the RP or the originator ID (the IP address of the interface used as the RP address), if configured.

Each MSDP peer receives and forwards the SA message away from the originating RP to achieve peer reverse-path flooding (RPF). The MSDP device examines the BGP or MBGP routing table to discover which peer is the next hop toward the originating RP of the SA message. Such a peer is called an *RPF peer* (reverse-path forwarding peer). The MSDP device forwards the message to all MSDP peers other than the RPF peer. For information on how to configure an MSDP peer when BGP and MBGP are not supported, see the [Configuring a Default MSDP Peer, on page 1324](#).

If the MSDP peer receives the same SA message from a non-RPF peer toward the originating RP, it drops the message. Otherwise, it forwards the message to all its MSDP peers.

The RP for a domain receives the SA message from an MSDP peer. If the RP has any join requests for the group the SA message describes and if the (\*,G) entry exists with a nonempty outgoing interface list, the domain is interested in the group, and the RP triggers an (S,G) join toward the source. After the (S,G) join reaches the source's DR, a branch of the source tree has been built from the source to the RP in the remote domain. Multicast traffic can now flow from the source across the source tree to the RP and then down the shared tree in the remote domain to the receiver.

**Figure 81: MSDP Running Between RP Peers**

This figure shows MSDP operating between two MSDP peers. PIM uses MSDP as the standard mechanism to register a source with the RP of a domain. When MSDP is configured, this sequence occurs.

By default, the switch does not cache source or group pairs from received SA messages. When the switch forwards the MSDP SA information, it does not store it in memory. Therefore, if a member joins a group soon after an SA message is received by the local RP, that member needs to wait until the next SA message to hear about the source. This delay is known as join latency.

Local RPs can send SA requests and get immediate responses for all active sources for a given group. By default, the switch does not send any SA request messages to its MSDP peers when a new member joins a group and wants to receive multicast traffic. The new member waits to receive the next periodic SA message.

If you want a new member of a group to learn the active multicast sources in a connected PIM sparse-mode domain that are sending to a group, configure the switch to send SA request messages to the specified MSDP peer when a new member joins a group.

## MSDP Benefits

MSDP has these benefits:

- It breaks up the shared multicast distribution tree. You can make the shared tree local to your domain. Your local members join the local tree, and join messages for the shared tree never need to leave your domain.
- PIM sparse-mode domains can rely only on their own RPs, decreasing reliance on RPs in another domain. This increases security because you can prevent your sources from being known outside your domain.
- Domains with only receivers can receive data without globally advertising group membership.
- Global source multicast routing table state is not required, saving memory.

# How to Configure MSDP

## Default MSDP Configuration

MSDP is not enabled, and no default MSDP peer exists.

## Configuring a Default MSDP Peer

### Before you begin

Configure an MSDP peer.

### Procedure

|               | Command or Action                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

The range is 1 to 4294967294.</li> <li>• The <b>deny</b> keyword denies access to matching conditions.</li> <li>• The <b>permit</b> keyword permits access to matching conditions.</li> <li>• For <i>network length</i>, specify the network number and length (in bits) of the network mask that is permitted or denied.</li> </ul> |
| <b>Step 5</b> | <p><b>ip msdp description</b> {<i>peer-name</i>   <i>peer-address</i>} <i>text</i></p> <p><b>Example:</b></p> <pre>Router(config)# ip msdp description peer-name site-b</pre>                                                                                         | <p>(Optional) Configures a description for the specified peer to make it easier to identify in a configuration or in <b>show</b> command output.</p> <p>By default, no description is associated with an MSDP peer.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 6</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                                                                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>                                                                                                                                                                       | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 8</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                                                                                                                         | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Caching Source-Active State

If you want to sacrifice some memory in exchange for reducing the latency of the source information, you can configure the Device to cache SA messages. Perform the following steps to enable the caching of source/group pairs:

Follow these steps to enable the caching of source/group pairs:

### Procedure

|               | Command or Action                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                          | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>ip msdp cache-sa-state [list access-list-number]</b><br><b>Example:</b><br>Device(config)# <b>ip msdp cache-sa-state 100</b>                                                                                                            | Enables the caching of source/group pairs (create an SA state). Those pairs that pass the access list are cached.<br>For <b>list access-list-number</b> , the range is 100 to 199.<br><b>Note</b> An alternative to this command is the <b>ip msdp sa-reques</b> global configuration command, which causes the Device to send an SA request message to the MSDP peer when a new member for a group becomes active.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 4</b> | <b>access-list access-list-number {deny   permit} protocol source source-wildcard destination destination-wildcard</b><br><b>Example:</b><br>Device(config)# <b>access-list 100 permit ip 171.69.0.0 0.0.255.255 224.2.0.0 0.0.255.255</b> | Creates an IP extended access list, repeating the command as many times as necessary. <ul style="list-style-type: none"> <li>• For <i>access-list-number</i>, the range is 100 to 199. Enter the same number created in Step 2.</li> <li>• The <b>deny</b> keyword denies access if the conditions are matched. The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>• For <i>protocol</i>, enter <b>ip</b> as the protocol name.</li> <li>• For <i>source</i>, enter the number of the network or host from which the packet is being sent.</li> <li>• For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> </ul> |

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                       | <ul style="list-style-type: none"> <li>• For <i>destination</i>, enter the number of the network or host to which the packet is being sent.</li> <li>• For <i>destination-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.</li> </ul> <p>Recall that the access list is always terminated by an implicit deny statement for everything.</p> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br><pre>Device# show running-config</pre>                               | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                               |

## Controlling Source Information that Your Switch Originates

You can control the multicast source information that originates with your Device:

- Sources you advertise (based on your sources)
- Receivers of source information (based on knowing the requestor)

For more information, see the [Redistributing Sources, on page 1327](#) and the [Filtering Source-Active Request Messages, on page 1329](#).

### Redistributing Sources

SA messages originate on RPs to which sources have registered. By default, any source that registers with an RP is advertised. The *Aflag* is set in the RP when a source is registered, which means the source is advertised in an SA unless it is filtered.

Follow these steps to further restrict which registered sources are advertised:

## Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                                                                                                                                                                                                                      | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                                                                                                                                                              | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <b>ip msdp redistribute</b> [ <i>list access-list-name</i> ] [ <i>asn aspath-access-list-number</i> ] [ <i>route-map map</i> ]<br><b>Example:</b><br>Device(config)# <b>ip msdp redistribute list 21</b>                                                                                                                                                                                       | Configures which (S,G) entries from the multicast routing table are advertised in SA messages.<br>By default, only sources within the local domain are advertised. <ul style="list-style-type: none"> <li>• (Optional) <b>list</b> <i>access-list-name</i>— Enters the name or number of an IP standard or extended access list. The range is 1 to 99 for standard access lists and 100 to 199 for extended lists. The access list controls which local sources are advertised and to which groups they send.</li> <li>• (Optional) <b>asn</b> <i>aspath-access-list-number</i>—Enters the IP standard or extended access list number in the range 1 to 199. This access list number must also be configured in the <b>ip as-path access-list</b> command.</li> <li>• (Optional) <b>route-map</b> <i>map</i>—Enters the IP standard or extended access list number in the range 1 to 199. This access list number must also be configured in the <b>ip as-path access-list</b> command.</li> </ul> The Device advertises (S,G) pairs according to the access list or autonomous system path access list. |
| <b>Step 4</b> | Use one of the following: <ul style="list-style-type: none"> <li>• <b>access-list</b><i>access-list-number</i><br/>               {deny permit}<br/> <i>source</i><br/>               [<i>source-wildcard</i>]</li> <li>• <b>access-list</b><i>access-list-number</i><br/>               {deny permit}<br/> <i>protocol source source-wildcard destination destination-wildcard</i></li> </ul> | Creates an IP standard access list, repeating the command as many times as necessary.<br>or<br>Creates an IP extended access list, repeating the command as many times as necessary. <ul style="list-style-type: none"> <li>• <i>access-list-number</i>—Enters the same number created in Step 2. The range is 1 to 99 for standard access lists and 100 to 199 for extended lists.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|               | Command or Action                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Example:</b></p> <pre>Device(config)# access list 21 permit 194.1.22.0</pre> <p>or</p> <pre>Device(config)# access list 21 permit ip 194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1</pre> | <ul style="list-style-type: none"> <li>• <b>deny</b>—Denies access if the conditions are matched. The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>• <i>protocol</i>—Enters <b>ip</b> as the protocol name.</li> <li>• <i>source</i>—Enters the number of the network or host from which the packet is being sent.</li> <li>• <i>source-wildcard</i>—Enters the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> <li>• <i>destination</i>—Enters the number of the network or host to which the packet is being sent.</li> <li>• <i>destination-wildcard</i>—Enters the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.</li> </ul> <p>Recall that the access list is always terminated by an implicit deny statement for everything.</p> |

| <b>Step 6</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>                                                                                        | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 7</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                                          | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Filtering Source-Active Request Messages

By default, only Device that are caching SA information can respond to SA requests. By default, such a Device honors all SA request messages from its MSDP peers and supplies the IP addresses of the active sources.

However, you can configure the Device to ignore all SA requests from an MSDP peer. You can also honor only those SA request messages from a peer for groups described by a standard access list. If the groups in the access list pass, SA request messages are accepted. All other such messages from the peer for other groups are ignored.

To return to the default setting, use the **no ip msdp filter-sa-request** *{ip-address| name}* global configuration command.

Follow these steps to configure one of these options:

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                                                                                                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                                                                          | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | Use one of the following: <ul style="list-style-type: none"> <li>• ip msdp filter-sa-request <i>{ip-addressname}</i></li> <li>• ip msdp filter-sa-request <i>{ip-addressname}</i> list <i>access-list-number</i></li> </ul> <b>Example:</b><br>Device(config)# <b>ip msdp filter sa-request 171.69.2.2</b> | Filters all SA request messages from the specified MSDP peer.<br>or<br>Filters SA request messages from the specified MSDP peer for groups that pass the standard access list. The access list describes a multicast group address. The range for the access-list-number is 1 to 99.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 4</b> | <b>access-list</b> <i>access-list-number</i> {deny   permit} <i>source</i> [ <i>source-wildcard</i> ]<br><b>Example:</b><br>Device(config)# <b>access-list 1 permit 192.4.22.0 0.0.0.255</b>                                                                                                               | Creates an IP standard access list, repeating the command as many times as necessary. <ul style="list-style-type: none"> <li>• For <i>access-list-number</i>, the range is 1 to 99.</li> <li>• The <b>deny</b> keyword denies access if the conditions are matched. The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>• For <i>source</i>, enter the number of the network or host from which the packet is being sent.</li> <li>• (Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> </ul> Recall that the access list is always terminated by an implicit deny statement for everything. |

|        | Command or Action                                                                                                 | Purpose                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                         |
| Step 6 | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                               | Verifies your entries.                                   |
| Step 7 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Controlling Source Information that Your Switch Forwards

By default, the Device forwards all SA messages it receives to all its MSDP peers. However, you can prevent outgoing messages from being forwarded to a peer by using a filter or by setting a time-to-live (TTL) value.

### Using a Filter

By creating a filter, you can perform one of these actions:

- Filter all source/group pairs
- Specify an IP extended access list to pass only certain source/group pairs
- Filter based on match criteria in a route map

Follow these steps to apply a filter:

#### Procedure

|        | Command or Action                                         | Purpose                                                        |
|--------|-----------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b> | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b>              | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                       |
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br><pre>Device# show running-config</pre>                               | Verifies your entries.                                                                                                                                                                                                                                                                                                                 |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                               |

## Using TTL to Limit the Multicast Data Sent in SA Messages

You can use a TTL value to control what data is encapsulated in the first SA message for every source. Only multicast packets with an IP-header TTL greater than or equal to the *tll* argument are sent to the specified MSDP peer. For example, you can limit internal traffic to a TTL of 8. If you want other groups to go to external locations, you must send those packets with a TTL greater than 8.

Follow these steps to establish a TTL threshold:

### Procedure

|               | Command or Action                                                                     | Purpose                                                        |
|---------------|---------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                      | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre> | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>ip msdp ttl-threshold</b> <i>{ip-address   name}</i> <i>ttl</i><br><b>Example:</b><br><pre>Device(config)# ip msdp ttl-threshold switch.cisco.com 0</pre> | Limits which multicast data is encapsulated in the first SA message to the specified MSDP peer. <ul style="list-style-type: none"> <li>For <i>ip-address   name</i>, enter the IP address or name of the MSDP peer to which the TTL limitation applies.</li> <li>For <i>ttl</i>, enter the TTL value. The default is 0, which means all multicast data packets are forwarded to the peer until the TTL is exhausted. The range is 0 to 255.</li> </ul> |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                                                              | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 5</b> | <b>show running-config</b><br><b>Example:</b><br><pre>Device# show running-config</pre>                                                                      | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre>                                        | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                               |

## Controlling Source Information that Your Switch Receives

By default, the Device receives all SA messages that its MSDP RPF peers send to it. However, you can control the source information that you receive from MSDP peers by filtering incoming SA messages. In other words, you can configure the Device to not accept them.

You can perform one of these actions:

- Filter all incoming SA messages from an MSDP peer
- Specify an IP extended access list to pass certain source/group pairs
- Filter based on match criteria in a route map

Follow these steps to apply a filter:

### Procedure

|               | Command or Action                | Purpose                                                        |
|---------------|----------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|               | Device> <b>enable</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | Use one of the following: <ul style="list-style-type: none"> <li>• <b>ip msdp sa-filter in</b><br/>               {ip-address name}</li> <li>• <b>ip msdp sa-filter in</b><br/>               {ip-address name}<br/>               list access-list-number</li> <li>• <b>ip msdp sa-filter in</b><br/>               {ip-address name}<br/>               route-map map-tag</li> </ul> <b>Example:</b><br>Device(config)# <b>ip msdp sa-filter in</b><br><b>switch.cisco.com</b><br><br>or<br>Device(config)# <b>ip msdp sa-filter in list 100</b><br><br>or<br>Device(config)# <b>ip msdp sa-filter in</b><br><b>switch.cisco.com route-map 22</b> | <ul style="list-style-type: none"> <li>• Filters all SA messages to the specified MSDP peer.</li> <li>• Passes only those SA messages from the specified peer that pass the IP extended access list. The range for the extended <i>access-list-number</i> is 100 to 199.<br/><br/>             If both the <b>list</b> and the <b>route-map</b> keywords are used, all conditions must be true to pass any (S,G) pair in outgoing SA messages.</li> <li>• Passes only those SA messages from the specified MSDP peer that meet the match criteria in the route map <i>map-tag</i>.<br/><br/>             If all match criteria are true, a <b>permit</b> from the route map passes routes through the filter. A <b>deny</b> filters routes.</li> </ul> |
| <b>Step 4</b> | <b>access-list access-list-number {deny   permit} protocol source source-wildcard destination destination-wildcard</b><br><b>Example:</b><br>Device(config)# <b>access list 100 permit ip</b><br><b>194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1</b>                                                                                                                                                                                                                                                                                                                                                                                                       | (Optional) Creates an IP extended access list, repeating the command as many times as necessary. <ul style="list-style-type: none"> <li>• <i>access-list-number</i>, enter the number specified in Step 2.</li> <li>• The <b>deny</b> keyword denies access if the conditions are matched. The <b>permit</b> keyword permits access if the conditions are matched.</li> <li>• For <i>protocol</i>, enter <b>ip</b> as the protocol name.</li> <li>• For <i>source</i>, enter the number of the network or host from which the packet is being sent.</li> </ul>                                                                                                                                                                                         |

|               | Command or Action                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                   | <ul style="list-style-type: none"> <li>For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</li> <li>For <i>destination</i>, enter the number of the network or host to which the packet is being sent.</li> <li>For <i>destination-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.</li> </ul> <p>Recall that the access list is always terminated by an implicit deny statement for everything.</p> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                               | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Configuring an MSDP Mesh Group

An MSDP mesh group is a group of MSDP speakers that have fully meshed MSDP connectivity among one another. Any SA messages received from a peer in a mesh group are not forwarded to other peers in the same mesh group. Thus, you reduce SA message flooding and simplify peer-RPF flooding. Use the **ip msdp mesh-group** global configuration command when there are multiple RPs within a domain. It is especially used to send SA messages across a domain. You can configure multiple mesh groups (with different names) in a single Device.

Follow these steps to create a mesh group:

### Procedure

|               | Command or Action                | Purpose                                                        |
|---------------|----------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device> <code>enable</code>                                                                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                     | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>ip msdp mesh-group name {ip-address   name}</b><br><b>Example:</b><br>Device(config)# <code>ip msdp mesh-group 2 switch.cisco.com</code> | Configures an MSDP mesh group, and specifies the MSDP peer belonging to that mesh group.<br>By default, the MSDP peers do not belong to a mesh group. <ul style="list-style-type: none"> <li>• For <i>name</i>, enter the name of the mesh group.</li> <li>• For <i>ip-address   name</i>, enter the IP address or name of the MSDP peer to be a member of the mesh group.</li> </ul> Repeat this procedure on each MSDP peer in the group. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 5</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                                                   | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code>                     | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                    |

## Shutting Down an MSDP Peer

If you want to configure many MSDP commands for the same peer and you do not want the peer to become active, you can shut down the peer, configure it, and later bring it up. When a peer is shut down, the TCP connection is terminated and is not restarted. You can also shut down an MSDP session without losing configuration information for the peer.

Follow these steps to shut down a peer:

## Procedure

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                      |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> <b>enable</b>                                                                                         | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                               |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                                                 | Enters the global configuration mode.                                                                                                                                                        |
| <b>Step 3</b> | <b>ip msdp shutdown</b> { <i>peer-name</i>   <i>peer address</i> }<br><b>Example:</b><br><br>Device(config)# <b>ip msdp shutdown switch.cisco.com</b> | Shuts down the specified MSDP peer without losing configuration information.<br><br>For <i>peer-name</i>   <i>peer address</i> , enter the IP address or name of the MSDP peer to shut down. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                                                       | Returns to privileged EXEC mode.                                                                                                                                                             |
| <b>Step 5</b> | <b>show running-config</b><br><b>Example:</b><br><br>Device# <b>show running-config</b>                                                               | Verifies your entries.                                                                                                                                                                       |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b>                                 | (Optional) Saves your entries in the configuration file.                                                                                                                                     |

## Including a Bordering PIM Dense-Mode Region in MSDP

You can configure MSDP on a Device that borders a PIM sparse-mode region with a dense-mode region. By default, active sources in the dense-mode region do not participate in MSDP.

**Note** We do not recommend using the **ip msdp border sa-address** global configuration command. It is better to configure the border router in the sparse-mode domain to proxy-register sources in the dense-mode domain to the RP of the sparse-mode domain and have the sparse-mode domain use standard MSDP procedures to advertise these sources.

The **ip msdp originator-id** global configuration command also identifies an interface to be used as the RP address. If both the **ip msdp border sa-address** and the **ip msdp originator-id** global configuration commands are configured, the address derived from the **ip msdp originator-id** command specifies the RP address.

Follow these steps to configure the border router to send SA messages for sources active in the dense-mode region to the MSDP peers:

### Procedure

|        | Command or Action                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                      | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                            |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                              | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                     |
| Step 3 | <b>ip msdp border sa-address interface-id</b><br><b>Example:</b><br>Device(config)# <b>ip msdp border sa-address 0/1</b>                                                       | Configures the switch on the border between a dense-mode and sparse-mode region to send SA messages about active sources in the dense-mode region.<br><br>For <i>interface-id</i> , specifies the interface from which the IP address is derived and used as the RP address in SA messages.<br><br>The IP address of the interface is used as the Originator-ID, which is the RP field in the SA message. |
| Step 4 | <b>ip msdp redistribute [list access-list-name] [asn aspath-access-list-number] [route-map map]</b><br><b>Example:</b><br>Device(config)# <b>ip msdp redistribute list 100</b> | Configures which (S,G) entries from the multicast routing table are advertised in SA messages.<br><br>For more information, see the <a href="#">Redistributing Sources, on page 1327</a> .                                                                                                                                                                                                                |
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                          |

|               | Command or Action                                                                                                       | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                               | Verifies your entries.                                   |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring an Originating Address other than the RP Address

You can allow an MSDP speaker that originates an SA message to use the IP address of the interface as the RP address in the SA message by changing the Originator ID. You might change the Originator ID in one of these cases:

- If you configure a logical RP on multiple Device in an MSDP mesh group.
- If you have a Device that borders a PIM sparse-mode domain and a dense-mode domain. If a Device borders a dense-mode domain for a site, and sparse-mode is being used externally, you might want dense-mode sources to be known to the outside world. Because this Device is not an RP, it would not have an RP address to use in an SA message. Therefore, this command provides the RP address by specifying the address of the interface.

If both the **ip msdp border sa-address** and the **ip msdp originator-id** global configuration commands are configured, the address derived from the **ip msdp originator-id** command specifies the address of the RP.

Follow these steps to allow an MSDP speaker that originates an SA message to use the IP address on the interface as the RP address in the SA message:

### Procedure

|               | Command or Action                                                                       | Purpose                                                        |
|---------------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                          |

|        | Command or Action                                                                                                       | Purpose                                                                                                                                                                     |
|--------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3 | <b>ip msdp originator-id</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>ip msdp originator-id</b> 0/1 | Configures the RP address in SA messages to be the address of the originating device interface.<br><br>For <i>interface-id</i> , specify the interface on the local Device. |
| Step 4 | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                             | Returns to privileged EXEC mode.                                                                                                                                            |
| Step 5 | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                                     | Verifies your entries.                                                                                                                                                      |
| Step 6 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>       | (Optional) Saves your entries in the configuration file.                                                                                                                    |

## Monitoring and Maintaining MSDP

Commands that monitor MSDP SA messages, peers, state, and peer status:

**Table 100: Commands for Monitoring and Maintaining MSDP**

| Command                                                                                                                                                    | Purpose                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>debug ip msdp</b> [ <i>peer-address</i>   <i>name</i> ] [ <b>detail</b> ] [ <b>routes</b> ]                                                             | Debugs an MSDP activity.                                                                                                                                                                              |
| <b>debug ip msdp resets</b>                                                                                                                                | Debugs MSDP peer reset reasons.                                                                                                                                                                       |
| <b>show ip msdp count</b> [ <i>autonomous-system-number</i> ]                                                                                              | Displays the number of sources and groups originated in SA messages from each autonomous system. The <b>ip msdp cache-sa-state</b> command must be configured for this command to produce any output. |
| <b>show ip msdp peer</b> [ <i>peer-address</i>   <i>name</i> ]                                                                                             | Displays detailed information about an MSDP peer.                                                                                                                                                     |
| <b>show ip msdp sa-cache</b> [ <i>group-address</i>   <i>source-address</i>   <i>group-name</i>   <i>source-name</i> ] [ <i>autonomous-system-number</i> ] | Displays (S,G) state learned from MSDP peers.                                                                                                                                                         |

| Command                           | Purpose                                          |
|-----------------------------------|--------------------------------------------------|
| <code>show ip msdp summary</code> | Displays MSDP peer status and SA message counts. |

Commands that clear MSDP connections, statistics, and SA cache entries:

*Table 101: Commands for Clearing MSDP Connections, Statistics, or SA Cache Entries*

| Command                                                                   | Purpose                                                                                                                         |
|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <code>clear ip msdp peer <i>peer-address</i>   <i>name</i></code>         | Clears the TCP connection to the specified MSDP peer, resetting all MSDP message counters.                                      |
| <code>clear ip msdp statistics [<i>peer-address</i>   <i>name</i>]</code> | Clears statistics counters for one or all the MSDP peers without resetting the sessions.                                        |
| <code>clear ip msdp sa-cache [<i>group-address</i>   <i>name</i>]</code>  | Clears the SA cache entries for all entries, all sources for a specific group, or all entries for a specific source/group pair. |

## Configuration Examples for Configuring MSDP

### Configuring a Default MSDP Peer: Example

This example shows a partial configuration of Router A and Router C in . Each of these ISPs have more than one customer (like the customer in ) who use default peering (no BGP or MBGP). In that case, they might have similar configurations. That is, they accept SAs only from a default peer if the SA is permitted by the corresponding prefix list.

Router A

```
Router(config)# ip msdp default-peer 10.1.1.1
Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a
Router(config)# ip prefix-list site-b permit 10.0.0.0/1
```

Router C

```
Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a
Router(config)# ip prefix-list site-b permit 10.0.0.0/1
```

### Caching Source-Active State: Example

This example shows how to enable the cache state for all sources in 171.69.0.0/16 sending to groups 224.2.0.0/16:

```
Device(config)# ip msdp cache-sa-state 100
Device(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.2.0.0 0.0.255.255
```

## Controlling Source Information that Your Switch Originates: Example

This example shows how to configure the switch to filter SA request messages from the MSDP peer at 171.69.2.2. SA request messages from sources on network 192.4.22.0 pass access list 1 and are accepted; all others are ignored.

```
Device(config)# ip msdp filter sa-request 171.69.2.2 list 1
Device(config)# access-list 1 permit 192.4.22.0 0.0.0.255
```

## Controlling Source Information that Your Switch Forwards: Example

This example shows how to allow only (S,G) pairs that pass access list 100 to be forwarded in an SA message to the peer named *switch.cisco.com*:

```
Device(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet1/0/1
Device(config)# ip msdp sa-filter out switch.cisco.com list 100
Device(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.20 0 0.0.255.255
```

## Controlling Source Information that Your Switch Receives: Example

This example shows how to filter all SA messages from the peer named *switch.cisco.com*:

```
Device(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet1/0/1
Device(config)# ip msdp sa-filter in switch.cisco.com
```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Configuring IP Unicast Routing

This module describes how to configure IP Version 4 (IPv4) unicast routing on the switch.

**Note** On switches running the LAN base feature, static routing on VLANs is supported only with this release.

A switch stack operates and appears as a single router to the rest of the routers in the network. Basic routing functions like static routing and the Routing Information Protocol (RIP), are available with both the IP Base feature set and the IP Services feature set. To use advanced routing features and other routing protocols, you must have the IP Services feature set enabled on the standalone switch or on the active switch.

**Note** In addition to IPv4 traffic, you can also enable IP Version 6 (IPv6) unicast routing and configure interfaces to forward IPv6 traffic if the switch or switch stack is running the IP Base or IP Services feature set.

## Information About IP Routing

In some network environments, VLANs are associated with individual networks or subnetworks. In an IP network, each subnetwork is mapped to an individual VLAN. Configuring VLANs helps control the size of the broadcast domain and keeps local traffic local. However, network devices in different VLANs cannot communicate with one another without a Layer 3 device (router) to route traffic between the VLAN, referred to as inter-VLAN routing. You configure one or more routers to route traffic to the appropriate destination VLAN.

**Figure 82: Routing Topology Example**

This figure shows a basic routing topology. Switch A is in VLAN 10, and Switch B is in VLAN 20. The router

has an interface in each VLAN.

When Host A in VLAN 10 needs to communicate with Host B in VLAN 10, it sends a packet addressed to that host. Switch A forwards the packet directly to Host B, without sending it to the router.

When Host A sends a packet to Host C in VLAN 20, Switch A forwards the packet to the router, which receives the traffic on the VLAN 10 interface. The router checks the routing table, finds the correct outgoing interface, and forwards the packet on the VLAN 20 interface to Switch B. Switch B receives the packet and forwards it to Host C.

## Types of Routing

Routers and Layer 3 switches can route packets in these ways:

- By using default routing
- By using preprogrammed static routes for the traffic
- By dynamically calculating routes by using a routing protocol

Default routing refers to sending traffic with a destination unknown to the router to a default outlet or destination.

Static unicast routing forwards packets from predetermined ports through a single path into and out of a network. Static routing is secure and uses little bandwidth, but does not automatically respond to changes in the network, such as link failures, and therefore, might result in unreachable destinations. As networks grow, static routing becomes a labor-intensive liability.

Switches running the LAN base feature set support 16 user-configured static routes, in addition to any default routes used for the management interface. The LAN base image supports static routing only on SVIs.

Dynamic routing protocols are used by routers to dynamically calculate the best route for forwarding traffic. There are two types of dynamic routing protocols:

- Routers using distance-vector protocols maintain routing tables with distance values of networked resources, and periodically pass these tables to their neighbors. Distance-vector protocols use one or a series of metrics for calculating the best routes. These protocols are easy to configure and use.
- Routers using link-state protocols maintain a complex database of network topology, based on the exchange of link-state advertisements (LSAs) between routers. LSAs are triggered by an event in the network, which speeds up the convergence time or time required to respond to these changes. Link-state protocols respond quickly to topology changes, but require greater bandwidth and more resources than distance-vector protocols.

Distance-vector protocols supported by the switch are Routing Information Protocol (RIP), which uses a single distance metric (cost) to determine the best path and Border Gateway Protocol (BGP), which adds a path vector mechanism. The switch also supports the Open Shortest Path First (OSPF) link-state protocol and Enhanced IGRP (EIGRP), which adds some link-state routing features to traditional Interior Gateway Routing Protocol (IGRP) to improve efficiency.

---

**Note** On a switch or switch stack, the supported protocols are determined by the software running on the active switch. If the active switch is running the IP base feature set, only default routing, static routing and RIP are supported. If the switch is running the LAN base feature set, you can configure 16 static routes on SVIs. All other routing protocols require the IP services feature set.

---

## IP Routing and Switch Stacks

A switch stack appears to the network as a single switch, regardless of which switch in the stack is connected to a routing peer.

The active switch performs these functions:

- It initializes and configures the routing protocols.
- It sends routing protocol messages and updates to other routers.
- It processes routing protocol messages and updates received from peer routers.
- It generates, maintains, and distributes the distributed Cisco Express Forwarding (dCEF) database to all stack members. The routes are programmed on all switches in the stack bases on this database.
- The MAC address of the active switch is used as the router MAC address for the whole stack, and all outside devices use this address to send IP packets to the stack.
- All IP packets that require software forwarding or processing go through the CPU of the active switch.

Stack members perform these functions:

- They act as routing standby switches, ready to take over in case they are elected as the new active switch if the active switch fails.
- They program the routes into hardware.

If a active switch fails, the stack detects that the active switch is down and elects one of the stack members to be the new active switch. During this period, except for a momentary interruption, the hardware continues to forward packets with no active protocols.

However, even though the switch stack maintains the hardware identification after a failure, the routing protocols on the router neighbors might flap during the brief interruption before the active switch restarts. Routing protocols such as OSPF and EIGRP need to recognize neighbor transitions. The router uses two levels of nonstop forwarding (NSF) to detect a switchover, to continue forwarding network traffic, and to recover route information from peer devices:

- NSF-aware routers tolerate neighboring router failures. After the neighbor router restarts, an NSF-aware router supplies information about its state and route adjacencies on request.
- NSF-capable routers support NSF. When they detect a active switch change, they rebuild routing information from NSF-aware or NSF-capable neighbors and do not wait for a restart.

The switch stack supports NSF-capable routing for OSPF and EIGRP.

Upon election, the new active switch performs these functions:

- It starts generating, receiving, and processing routing updates.
- It builds routing tables, generates the CEF database, and distributes it to stack members.
- It uses its MAC address as the router MAC address. To notify its network peers of the new MAC address, it periodically (every few seconds for 5 minutes) sends a gratuitous ARP reply with the new router MAC address.

---

**Note** If you configure the persistent MAC address feature on the stack and the active switch changes, the stack MAC address does not change for the configured time period. If the previous active switch rejoins the stack as a member switch during that time period, the stack MAC address remains the MAC address of the previous active switch.

---

- It attempts to determine the reachability of every proxy ARP entry by sending an ARP request to the proxy ARP IP address and receiving an ARP reply. For each reachable proxy ARP IP address, it generates a gratuitous ARP reply with the new router MAC address. This process is repeated for 5 minutes after a new active switch election.

---

**Note** When a active switch is running the IP services feature set, the stack can run all supported protocols, including Open Shortest Path First (OSPF), and Enhanced IGRP (EIGRP) and Border Gateway Protocol (BGP). If the active switch fails and the new elected active switch is running the IP base or LAN base feature set, these protocols will no longer run in the stack.

---

---

**Caution** Partitioning of the switch stack into two or more stacks might lead to undesirable behavior in the network.

---

If the switch is reloaded, then all the ports on that switch go down and there is a loss of traffic for the interfaces involved in routing, despite NSF/SSO capability.

## Classless Routing

By default, classless routing behavior is enabled on the Device when it is configured to route. With classless routing, if a router receives packets for a subnet of a network with no default route, the router forwards the packet to the best supernet route. A supernet consists of contiguous blocks of Class C address spaces used to simulate a single, larger address space and is designed to relieve the pressure on the rapidly depleting Class B address space.

In the figure, classless routing is enabled. When the host sends a packet to 120.20.4.1, instead of discarding the packet, the router forwards it to the best supernet route. If you disable classless routing and a router receives packets destined for a subnet of a network with no network default route, the router discards the packet.

Figure 83: IP Classless Routing

In the figure, the router in network 128.20.0.0 is connected to subnets 128.20.1.0, 128.20.2.0, and 128.20.3.0. If the host sends a packet to 128.20.4.1, because there is no network default route, the router discards the packet.

Figure 84: No IP Classless Routing

To prevent the Device from forwarding packets destined for unrecognized subnets to the best supernet route possible, you can disable classless routing behavior.

## Address Resolution

You can control interface-specific handling of IP by using address resolution. A device using IP can have both a local address or MAC address, which uniquely defines the device on its local segment or LAN, and a network address, which identifies the network to which the device belongs.

**Note** In a switch stack, network communication uses a single MAC address and the IP address of the stack.

The local address or MAC address is known as a data link address because it is contained in the data link layer (Layer 2) section of the packet header and is read by data link (Layer 2) devices. To communicate with a device on Ethernet, the software must learn the MAC address of the device. The process of learning the MAC address from an IP address is called *address resolution*. The process of learning the IP address from the MAC address is called *reverse address resolution*.

The Device can use these forms of address resolution:

- Address Resolution Protocol (ARP) is used to associate IP address with MAC addresses. Taking an IP address as input, ARP learns the associated MAC address and then stores the IP address/MAC address association in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests or replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP).
- Proxy ARP helps hosts with no routing tables learn the MAC addresses of hosts on other networks or subnets. If the Device (router) receives an ARP request for a host that is not on the same interface as the ARP request sender, and if the router has all of its routes to the host through other interfaces, it generates a proxy ARP packet giving its own local data link address. The host that sent the ARP request then sends its packets to the router, which forwards them to the intended host.

The Device also uses the Reverse Address Resolution Protocol (RARP), which functions the same as ARP does, except that the RARP packets request an IP address instead of a local MAC address. Using RARP requires a RARP server on the same network segment as the router interface. Use the **ip rarp-server address** interface configuration command to identify the server.

For more information on RARP, see the *Cisco IOS Configuration Fundamentals Configuration Guide*

## Proxy ARP

Proxy ARP, the most common method for learning about other routes, enables an Ethernet host with no routing information to communicate with hosts on other networks or subnets. The host assumes that all hosts are on the same local Ethernet and that they can use ARP to learn their MAC addresses. If a Device receives an ARP request for a host that is not on the same network as the sender, the Device evaluates whether it has the best route to that host. If it does, it sends an ARP reply packet with its own Ethernet MAC address, and the host that sent the request sends the packet to the Device, which forwards it to the intended host. Proxy ARP treats all networks as if they are local and performs ARP requests for every IP address.

## ICMP Router Discovery Protocol

Router discovery allows the Device to dynamically learn about routes to other networks using ICMP router discovery protocol (IRDP). IRDP allows hosts to locate routers. When operating as a client, the Device generates router discovery packets. When operating as a host, the Device receives router discovery packets. The Device can also listen to Routing Information Protocol (RIP) routing updates and use this information to infer locations of routers. The Device does not actually store the routing tables sent by routing devices; it merely keeps track of which systems are sending the data. The advantage of using IRDP is that it allows each router to specify both a priority and the time after which a device is assumed to be down if no further packets are received.

Each device discovered becomes a candidate for the default router, and a new highest-priority router is selected when a higher priority router is discovered, when the current default router is declared down, or when a TCP connection is about to time out because of excessive retransmissions.

## UDP Broadcast Packets and Protocols

User Datagram Protocol (UDP) is an IP host-to-host layer protocol, as is TCP. UDP provides a low-overhead, connectionless session between two end systems and does not provide for acknowledgment of received datagrams. Network hosts occasionally use UDP broadcasts to find address, configuration, and name information. If such a host is on a network segment that does not include a server, UDP broadcasts are normally not forwarded. You can remedy this situation by configuring an interface on a router to forward certain classes of broadcasts to a helper address. You can use more than one helper address per interface.

You can specify a UDP destination port to control which UDP services are forwarded. You can specify multiple UDP protocols. You can also specify the Network Disk (ND) protocol, which is used by older diskless Sun workstations and the network security protocol SDNS.

By default, both UDP and ND forwarding are enabled if a helper address has been defined for an interface. The description for the **ip forward-protocol** interface configuration command in the *Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services* lists the ports that are forwarded by default if you do not specify any UDP ports.

## Broadcast Packet Handling

After configuring an IP interface address, you can enable routing and configure one or more routing protocols, or you can configure the way the Device responds to network broadcasts. A broadcast is a data packet destined for all hosts on a physical network. The Device supports two kinds of broadcasting:

- A directed broadcast packet is sent to a specific network or series of networks. A directed broadcast address includes the network or subnet fields.
- A flooded broadcast packet is sent to every network.

---

**Note** You can also limit broadcast, unicast, and multicast traffic on Layer 2 interfaces by using the **storm-control** interface configuration command to set traffic suppression levels.

---

Routers provide some protection from broadcast storms by limiting their extent to the local cable. Bridges (including intelligent bridges), because they are Layer 2 devices, forward broadcasts to all network segments, thus propagating broadcast storms. The best solution to the broadcast storm problem is to use a single broadcast address scheme on a network. In most modern IP implementations, you can set the address to be used as the broadcast address. Many implementations, including the one in the Device, support several addressing schemes for forwarding broadcast messages.

## IP Broadcast Flooding

You can allow IP broadcasts to be flooded throughout your internetwork in a controlled fashion by using the database created by the bridging STP. Using this feature also prevents loops. To support this capability, bridging must be configured on each interface that is to participate in the flooding. If bridging is not configured

on an interface, it still can receive broadcasts. However, the interface never forwards broadcasts it receives, and the router never uses that interface to send broadcasts received on a different interface.

Packets that are forwarded to a single network address using the IP helper-address mechanism can be flooded. Only one copy of the packet is sent on each network segment.

To be considered for flooding, packets must meet these criteria. (Note that these are the same conditions used to consider packet forwarding using IP helper addresses.)

- The packet must be a MAC-level broadcast.
- The packet must be an IP-level broadcast.
- The packet must be a TFTP, DNS, Time, NetBIOS, ND, or BOOTP packet, or a UDP specified by the **ip forward-protocol udp** global configuration command.
- The time-to-live (TTL) value of the packet must be at least two.

A flooded UDP datagram is given the destination address specified with the **ip broadcast-address** interface configuration command on the output interface. The destination address can be set to any address. Thus, the destination address might change as the datagram propagates through the network. The source address is never changed. The TTL value is decremented.

When a flooded UDP datagram is sent out an interface (and the destination address possibly changed), the datagram is handed to the normal IP output routines and is, therefore, subject to access lists, if they are present on the output interface.

In the Device, the majority of packets are forwarded in hardware; most packets do not go through the Device CPU. For those packets that do go to the CPU, you can speed up spanning tree-based UDP flooding by a factor of about four to five times by using turbo-flooding. This feature is supported over Ethernet interfaces configured for ARP encapsulation.

## How to Configure IP Routing

By default, IP routing is disabled on the Device, and you must enable it before routing can take place. For detailed IP routing configuration information, see the *Cisco IOS IP Configuration Guide*.

In the following procedures, the specified interface must be one of these Layer 3 interfaces:

- A routed port: a physical port configured as a Layer 3 port by using the **no switchport** interface configuration command.
- A switch virtual interface (SVI): a VLAN interface created by using the **interface vlan** *vlan\_id* global configuration command and by default a Layer 3 interface.
- An EtherChannel port channel in Layer 3 mode: a port-channel logical interface created by using the **interface port-channel** *port-channel-number* global configuration command and binding the Ethernet interface into the channel group. For more information, see the “Configuring Layer 3 EtherChannels” chapter in the Layer 2 Configuration Guide.

---

**Note** The switch does not support tunnel interfaces for unicast routed traffic.

---

All Layer 3 interfaces on which routing will occur must have IP addresses assigned to them.

**Note** A Layer 3 switch can have an IP address assigned to each routed port and SVI.

The number of routed ports and SVIs that you can configure is limited to 128, exceeding the recommended number and volume of features being implemented might impact CPU utilization because of hardware limitations.

Configuring routing consists of several main procedures:

- To support VLAN interfaces, create and configure VLANs on the Device or switch stack, and assign VLAN membership to Layer 2 interfaces. For more information, see the "Configuring VLANs" chapter in the VLAN Configuration Guide.
- Configure Layer 3 interfaces.
- Enable IP routing on the switch.
- Assign IP addresses to the Layer 3 interfaces.
- Enable selected routing protocols on the switch.
- Configure routing protocol parameters (optional).

## How to Configure IP Addressing

A required task for configuring IP routing is to assign IP addresses to Layer 3 network interfaces to enable the interfaces and allow communication with the hosts on those interfaces that use IP. The following sections describe how to configure various IP addressing features. Assigning IP addresses to the interface is required; the other procedures are optional.

- Default Addressing Configuration
- Assigning IP Addresses to Network Interfaces
- Configuring Address Resolution Methods
- Routing Assistance When IP Routing is Disabled
- Configuring Broadcast Packet Handling
- Monitoring and Maintaining IP Addressing

## Default IP Addressing Configuration

*Table 102: Default Addressing Configuration*

| Feature    | Default Setting |
|------------|-----------------|
| IP address | None defined.   |

| Feature               | Default Setting                                                                                                                                                                                                                                                                               |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ARP                   | No permanent entries in the Address Resolution Protocol (ARP) cache.<br>Encapsulation: Standard Ethernet-style ARP.<br>Timeout: 14400 seconds (4 hours).                                                                                                                                      |
| IP broadcast address  | 255.255.255.255 (all ones).                                                                                                                                                                                                                                                                   |
| IP classless routing  | Enabled.                                                                                                                                                                                                                                                                                      |
| IP default gateway    | Disabled.                                                                                                                                                                                                                                                                                     |
| IP directed broadcast | Disabled (all IP directed broadcasts are dropped).                                                                                                                                                                                                                                            |
| IP domain             | Domain list: No domain names defined.<br>Domain lookup: Enabled.<br>Domain name: Enabled.                                                                                                                                                                                                     |
| IP forward-protocol   | If a helper address is defined or User Datagram Protocol (UDP) flooding is configured, UDP forwarding is enabled on default ports.<br>Any-local-broadcast: Disabled.<br>Spanning Tree Protocol (STP): Disabled.<br>Turbo-flood: Disabled.                                                     |
| IP helper address     | Disabled.                                                                                                                                                                                                                                                                                     |
| IP host               | Disabled.                                                                                                                                                                                                                                                                                     |
| IRDP                  | Disabled.<br>Defaults when enabled: <ul style="list-style-type: none"> <li>• Broadcast IRDP advertisements.</li> <li>• Maximum interval between advertisements: 600 seconds.</li> <li>• Minimum interval between advertisements: 0.75 times max interval</li> <li>• Preference: 0.</li> </ul> |
| IP proxy ARP          | Enabled.                                                                                                                                                                                                                                                                                      |
| IP routing            | Disabled.                                                                                                                                                                                                                                                                                     |
| IP subnet-zero        | Disabled.                                                                                                                                                                                                                                                                                     |

## Assigning IP Addresses to Network Interfaces

An IP address identifies a location to which IP packets can be sent. Some IP addresses are reserved for special uses and cannot be used for host, subnet, or network addresses. RFC 1166, “Internet Numbers,” contains the official description of IP addresses.

An interface can have one primary IP address. A mask identifies the bits that denote the network number in an IP address. When you use the mask to subnet a network, the mask is referred to as a subnet mask. To receive an assigned network number, contact your Internet service provider.

### Procedure

|               | Command or Action                                                                                                                     | Purpose                                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                             | Enables privileged EXEC mode. Enter your password if prompted.                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                     | Enters the global configuration mode.                                                  |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet 1/0/1</b>                     | Enters interface configuration mode, and specifies the Layer 3 interface to configure. |
| <b>Step 4</b> | <b>no switchport</b><br><b>Example:</b><br>Device(config-if)# <b>no switchport</b>                                                    | Removes the interface from Layer 2 configuration mode (if it is a physical interface). |
| <b>Step 5</b> | <b>ip address <i>ip-address subnet-mask</i></b><br><b>Example:</b><br>Device(config-if)# <b>ip address 10.1.5.1<br/>255.255.255.0</b> | Configures the IP address and IP subnet mask.                                          |
| <b>Step 6</b> | <b>no shutdown</b><br><b>Example:</b><br>Device(config-if)# <b>no shutdown</b>                                                        | Enables the physical interface.                                                        |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b>                                                                                                         | Returns to privileged EXEC mode.                                                       |

|                | Command or Action                                                                                             | Purpose                                                  |
|----------------|---------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | Device(config)# <b>end</b>                                                                                    |                                                          |
| <b>Step 8</b>  | <b>show ip route</b><br><b>Example:</b><br>Device# show ip route                                              | Verifies your entries.                                   |
| <b>Step 9</b>  | <b>show ip interface</b> [interface-id]<br><b>Example:</b><br>Device# show ip interface gigabitethernet 1/0/1 | Verifies your entries.                                   |
| <b>Step 10</b> | <b>show running-config</b><br><b>Example:</b><br>Device# show running-config                                  | Verifies your entries.                                   |
| <b>Step 11</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config    | (Optional) Saves your entries in the configuration file. |

## Using Subnet Zero

Subnetting with a subnet address of zero is strongly discouraged because of the problems that can arise if a network and a subnet have the same addresses. For example, if network 131.108.0.0 is subnetted as 255.255.255.0, subnet zero would be written as 131.108.0.0, which is the same as the network address.

You can use the all ones subnet (131.108.255.0) and even though it is discouraged, you can enable the use of subnet zero if you need the entire subnet space for your IP address.

Use the **no ip subnet-zero** global configuration command to restore the default and disable the use of subnet zero.

### Procedure

|               | Command or Action                                         | Purpose                                                        |
|---------------|-----------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b> | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>              | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                       | Purpose                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                                 |                                                                             |
| <b>Step 3</b> | <b>ip subnet-zero</b><br><b>Example:</b><br>Device(config)# <code>ip subnet-zero</code>                                 | Enables the use of subnet zero for interface addresses and routing updates. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                       | Returns to privileged EXEC mode.                                            |
| <b>Step 5</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                               | Verifies your entries.                                                      |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file.                    |

## Disabling Classless Routing

To prevent the Device from forwarding packets destined for unrecognized subnets to the best supernet route possible, you can disable classless routing behavior.

### Procedure

|               | Command or Action                                                                       | Purpose                                                        |
|---------------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                          |

|        | Command or Action                                                                                              | Purpose                                                  |
|--------|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 3 | <b>no ip classless</b><br><b>Example:</b><br><br>Device(config)#no ip classless                                | Disables classless routing behavior.                     |
| Step 4 | <b>end</b><br><b>Example:</b><br><br>Device(config)# end                                                       | Returns to privileged EXEC mode.                         |
| Step 5 | <b>show running-config</b><br><b>Example:</b><br><br>Device# show running-config                               | Verifies your entries.                                   |
| Step 6 | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

## Configuring Address Resolution Methods

You can perform the following tasks to configure address resolution.

### Defining a Static ARP Cache

ARP and other address resolution protocols provide dynamic mapping between IP addresses and MAC addresses. Because most hosts support dynamic address resolution, you usually do not need to specify static ARP cache entries. If you must define a static ARP cache entry, you can do so globally, which installs a permanent entry in the ARP cache that the Device uses to translate IP addresses into MAC addresses. Optionally, you can also specify that the Device respond to ARP requests as if it were the owner of the specified IP address. If you do not want the ARP entry to be permanent, you can specify a timeout period for the ARP entry.

#### Procedure

|        | Command or Action                                      | Purpose                                                        |
|--------|--------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><br>Device> enable | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b>           | Enters the global configuration mode.                          |

|                | Command or Action                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Device# <b>configure terminal</b>                                                                                               |                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b>  | <b>arp ip-address hardware-address type</b><br><b>Example:</b><br>Device(config)# ip 10.1.5.1 c2f3.220a.12f4 arpa               | Associates an IP address with a MAC (hardware) address in the ARP cache, and specifies encapsulation type as one of these: <ul style="list-style-type: none"> <li>• <b>arpa</b>—ARP encapsulation for Ethernet interfaces</li> <li>• <b>snap</b>—Subnetwork Address Protocol encapsulation for Token Ring and FDDI interfaces</li> <li>• <b>sap</b>—HP's ARP type</li> </ul> |
| <b>Step 4</b>  | <b>arp ip-address hardware-address type [alias]</b><br><b>Example:</b><br>Device(config)# ip 10.1.5.3 d7f3.220d.12f5 arpa alias | (Optional) Specifies that the switch respond to ARP requests as if it were the owner of the specified IP address.                                                                                                                                                                                                                                                            |
| <b>Step 5</b>  | <b>interface interface-id</b><br><b>Example:</b><br>Device(config)# interface gigabitethernet 1/0/1                             | Enters interface configuration mode, and specifies the interface to configure.                                                                                                                                                                                                                                                                                               |
| <b>Step 6</b>  | <b>arp timeout seconds</b><br><b>Example:</b><br>Device(config-if)# arp 20000                                                   | (Optional) Sets the length of time an ARP cache entry will stay in the cache. The default is 14400 seconds (4 hours). The range is 0 to 2147483 seconds.                                                                                                                                                                                                                     |
| <b>Step 7</b>  | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 8</b>  | <b>show interfaces [interface-id]</b><br><b>Example:</b><br>Device# show interfaces gigabitethernet 1/0/1                       | Verifies the type of ARP and the timeout value used on all interfaces or a specific interface.                                                                                                                                                                                                                                                                               |
| <b>Step 9</b>  | <b>show arp</b><br><b>Example:</b><br>Device# show arp                                                                          | Views the contents of the ARP cache.                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 10</b> | <b>show ip arp</b><br><b>Example:</b>                                                                                           | Views the contents of the ARP cache.                                                                                                                                                                                                                                                                                                                                         |

|                | Command or Action                                                                                                 | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | Device# show ip arp                                                                                               |                                                          |
| <b>Step 11</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Setting ARP Encapsulation

By default, Ethernet ARP encapsulation (represented by the **arpa** keyword) is enabled on an IP interface. You can change the encapsulation methods to SNAP if required by your network.

To disable an encapsulation type, use the **no arp arpa** or **no arp snap** interface configuration command.

### Procedure

|               | Command or Action                                                                                          | Purpose                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                          | Enters the global configuration mode.                                                                                                                                                  |
| <b>Step 3</b> | <b>interface interface-id</b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet 1/0/2</b> | Enters interface configuration mode, and specifies the Layer 3 interface to configure.                                                                                                 |
| <b>Step 4</b> | <b>arp {arpa   snap}</b><br><b>Example:</b><br>Device(config-if)# <b>arp arpa</b>                          | Specifies the ARP encapsulation method: <ul style="list-style-type: none"> <li>• <b>arpa</b>—Address Resolution Protocol</li> <li>• <b>snap</b>—Subnetwork Address Protocol</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                | Returns to privileged EXEC mode.                                                                                                                                                       |

|               | Command or Action                                                                                          | Purpose                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Step 6</b> | <b>show interfaces</b> [ <i>interface-id</i> ]<br><b>Example:</b><br>Device# show interfaces               | Verifies ARP encapsulation configuration on all interfaces or the specified interface. |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file.                               |

## Enabling Proxy ARP

By default, the Device uses proxy ARP to help hosts learn MAC addresses of hosts on other networks or subnets.

### Procedure

|               | Command or Action                                                                                          | Purpose                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                         | Enables privileged EXEC mode. Enter your password if prompted.                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                 | Enters the global configuration mode.                                                  |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# interface gigabitethernet 1/0/2 | Enters interface configuration mode, and specifies the Layer 3 interface to configure. |
| <b>Step 4</b> | <b>ip proxy-arp</b><br><b>Example:</b><br>Device(config-if)# ip proxy-arp                                  | Enables proxy ARP on the interface.                                                    |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                       | Returns to privileged EXEC mode.                                                       |

|               | Command or Action                                                                                                      | Purpose                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 6</b> | <b>show ip interface</b> [ <i>interface-id</i> ]<br><b>Example:</b><br>Device# show ip interface gigabitethernet 1/0/2 | Verifies the configuration on the interface or all interfaces. |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config             | (Optional) Saves your entries in the configuration file.       |

## Routing Assistance When IP Routing is Disabled

These mechanisms allow the Device to learn about routes to other networks when it does not have IP routing enabled:

- Proxy ARP
- Default Gateway
- ICMP Router Discovery Protocol (IRDP)

### Proxy ARP

Proxy ARP is enabled by default. To enable it after it has been disabled, see the “Enabling Proxy ARP” section. Proxy ARP works as long as other routers support it.

### Default Gateway

Another method for locating routes is to define a default router or default gateway. All non-local packets are sent to this router, which either routes them appropriately or sends an IP Control Message Protocol (ICMP) redirect message back, defining which local router the host should use. The Device caches the redirect messages and forwards each packet as efficiently as possible. A limitation of this method is that there is no means of detecting when the default router has gone down or is unavailable.

#### Procedure

|               | Command or Action                                  | Purpose                                                        |
|---------------|----------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>       | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                          | Purpose                                                                   |
|---------------|----------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                                    |                                                                           |
| <b>Step 3</b> | <b>ip default-gateway</b> <i>ip-address</i><br><b>Example:</b><br>Device(config)# <code>ip default gateway 10.1.5.1</code> | Sets up a default gateway (router).                                       |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                          | Returns to privileged EXEC mode.                                          |
| <b>Step 5</b> | <b>show ip redirects</b><br><b>Example:</b><br>Device# <code>show ip redirects</code>                                      | Displays the address of the default gateway router to verify the setting. |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code>    | (Optional) Saves your entries in the configuration file.                  |

## ICMP Router Discovery Protocol (IRDP)

The only required task for IRDP routing on an interface is to enable IRDP processing on that interface. When enabled, the default parameters apply.

You can optionally change any of these parameters. If you change the **maxadvertinterval** value, the **holdtime** and **minadvertinterval** values also change, so it is important to first change the **maxadvertinterval** value, before manually changing either the **holdtime** or **minadvertinterval** values.

### Procedure

|               | Command or Action                                                                       | Purpose                                                        |
|---------------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                          |

|         | Command or Action                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                        |
|---------|------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 3  | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# interface gigabitethernet 1/0/1             | Enters interface configuration mode, and specifies the Layer 3 interface to configure.                                                                                                                                                                                                                                                                         |
| Step 4  | <b>ip irdp</b><br><b>Example:</b><br>Device(config-if)# ip irdp                                                        | Enables IRDP processing on the interface.                                                                                                                                                                                                                                                                                                                      |
| Step 5  | <b>ip irdp multicast</b><br><b>Example:</b><br>Device(config-if)# ip irdp multicast                                    | (Optional) Sends IRDP advertisements to the multicast address (224.0.0.1) instead of IP broadcasts.<br><br><b>Note</b> This command allows for compatibility with Sun Microsystems Solaris, which requires IRDP packets to be sent out as multicasts. Many implementations cannot receive these multicasts; ensure end-host ability before using this command. |
| Step 6  | <b>ip irdp holdtime</b> <i>seconds</i><br><b>Example:</b><br>Device(config-if)# ip irdp holdtime 1000                  | (Optional) Sets the IRDP period for which advertisements are valid. The default is three times the <b>maxadvertinterval</b> value. It must be greater than <b>maxadvertinterval</b> and cannot be greater than 9000 seconds. If you change the <b>maxadvertinterval</b> value, this value also changes.                                                        |
| Step 7  | <b>ip irdp maxadvertinterval</b> <i>seconds</i><br><b>Example:</b><br>Device(config-if)# ip irdp maxadvertinterval 650 | (Optional) Sets the IRDP maximum interval between advertisements. The default is 600 seconds.                                                                                                                                                                                                                                                                  |
| Step 8  | <b>ip irdp minadvertinterval</b> <i>seconds</i><br><b>Example:</b><br>Device(config-if)# ip irdp minadvertinterval 500 | (Optional) Sets the IRDP minimum interval between advertisements. The default is 0.75 times the <b>maxadvertinterval</b> . If you change the <b>maxadvertinterval</b> , this value changes to the new default (0.75 of <b>maxadvertinterval</b> ).                                                                                                             |
| Step 9  | <b>ip irdp preference</b> <i>number</i><br><b>Example:</b><br>Device(config-if)# ip irdp preference 2                  | (Optional) Sets a device IRDP preference level. The allowed range is -231 to 231. The default is 0. A higher value increases the router preference level.                                                                                                                                                                                                      |
| Step 10 | <b>ip irdp address</b> <i>address [number]</i><br><b>Example:</b><br>Device(config-if)# ip irdp address 10.1.10.10     | (Optional) Specifies an IRDP address and preference to proxy-advertise.                                                                                                                                                                                                                                                                                        |

|                | Command or Action                                                                                                     | Purpose                                                  |
|----------------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 11</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                         |
| <b>Step 12</b> | <b>show ip irdp</b><br><b>Example:</b><br><br>Device# show ip irdp                                                    | Verifies settings by displaying IRDP values.             |
| <b>Step 13</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Configuring Broadcast Packet Handling

Perform the tasks in these sections to enable these schemes:

- Enabling Directed Broadcast-to-Physical Broadcast Translation
- Forwarding UDP Broadcast Packets and Protocols
- Establishing an IP Broadcast Address
- Flooding IP Broadcasts

### Enabling Directed Broadcast-to-Physical Broadcast Translation

By default, IP directed broadcasts are dropped; they are not forwarded. Dropping IP-directed broadcasts makes routers less susceptible to denial-of-service attacks.

You can enable forwarding of IP-directed broadcasts on an interface where the broadcast becomes a physical (MAC-layer) broadcast. Only those protocols configured by using the **ip forward-protocol** global configuration command are forwarded.

You can specify an access list to control which broadcasts are forwarded. When an access list is specified, only those IP packets permitted by the access list are eligible to be translated from directed broadcasts to physical broadcasts. For more information on access lists, see the “Information about Network Security with ACLs” section in the Security Configuration Guide.

#### Procedure

|               | Command or Action                | Purpose                                                        |
|---------------|----------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device> <b>enable</b>                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                       | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface</b> gigabitethernet 1/0/2                                       | Enters interface configuration mode, and specifies the interface to configure.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Step 4</b> | <b>ip directed-broadcast</b> [ <i>access-list-number</i> ]<br><b>Example:</b><br>Device(config-if)# <b>ip directed-broadcast</b> 103                    | Enables directed broadcast-to-physical broadcast translation on the interface. You can include an access list to control which broadcasts are forwarded. When an access list, only IP packets permitted by the access list can be translated.<br><br><b>Note</b> The <b>ip directed-broadcast</b> interface configuration command can be configured on a VPN routing/forwarding(VRF) interface and is VRF aware. Directed broadcast traffic is routed only within the VRF. |
| <b>Step 5</b> | <b>exit</b><br><b>Example:</b><br>Device(config-if)# <b>exit</b>                                                                                        | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 6</b> | <b>ip forward-protocol</b> { <b>udp</b> [ <i>port</i> ]   <b>nd</b>   <b>sdns</b> }<br><b>Example:</b><br>Device(config)# <b>ip forward-protocol</b> nd | Specifies which protocols and ports the router forwards when forwarding broadcast packets.<br><br><ul style="list-style-type: none"> <li>• <b>udp</b>—Forward UPD datagrams.<br/>port: (Optional) Destination port that controls which UDP services are forwarded.</li> <li>• <b>nd</b>—Forward ND datagrams.</li> <li>• <b>sdns</b>—Forward SDNS datagrams</li> </ul>                                                                                                     |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                             | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                | Command or Action                                                                                          | Purpose                                                       |
|----------------|------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| <b>Step 8</b>  | <b>show ip interface</b> [ <i>interface-id</i> ]<br><b>Example:</b><br>Device# show ip interface           | Verifies the configuration on the interface or all interfaces |
| <b>Step 9</b>  | <b>show running-config</b><br><b>Example:</b><br>Device# show running-config                               | Verifies your entries.                                        |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file.      |

## Forwarding UDP Broadcast Packets and Protocols

If you do not specify any UDP ports when you configure the forwarding of UDP broadcasts, you are configuring the router to act as a BOOTP forwarding agent. BOOTP packets carry DHCP information.

### Procedure

|               | Command or Action                                                                                            | Purpose                                                                                                         |
|---------------|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> enable                                                           | Enables privileged EXEC mode. Enter your password if prompted.                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                   | Enters the global configuration mode.                                                                           |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# interface gigabitethernet 1/0/1   | Enters interface configuration mode, and specifies the Layer 3 interface to configure.                          |
| <b>Step 4</b> | <b>ip helper-address</b> <i>address</i><br><b>Example:</b><br>Device(config-if)# ip helper address 10.1.10.1 | Enables forwarding and specifies the destination address for forwarding UDP broadcast packets, including BOOTP. |

|                | Command or Action                                                                                                      | Purpose                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <b>Step 5</b>  | <b>exit</b><br><b>Example:</b><br><br>Device(config-if)# exit                                                          | Returns to global configuration mode.                                            |
| <b>Step 6</b>  | <b>ip forward-protocol {udp [port]   nd   sdns}</b><br><b>Example:</b><br><br>Device(config)# ip forward-protocol sdns | Specifies which protocols the router forwards when forwarding broadcast packets. |
| <b>Step 7</b>  | <b>end</b><br><b>Example:</b><br><br>Device(config)# end                                                               | Returns to privileged EXEC mode.                                                 |
| <b>Step 8</b>  | <b>show ip interface [interface-id]</b><br><b>Example:</b><br><br>Device# show ip interface gigabitethernet 1/0/1      | Verifies the configuration on the interface or all interfaces.                   |
| <b>Step 9</b>  | <b>show running-config</b><br><b>Example:</b><br><br>Device# show running-config                                       | Verifies your entries.                                                           |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# copy running-config startup-config         | (Optional) Saves your entries in the configuration file.                         |

## Establishing an IP Broadcast Address

The most popular IP broadcast address (and the default) is an address consisting of all ones (255.255.255.255). However, the Device can be configured to generate any form of IP broadcast address.

### Procedure

|               | Command or Action                                      | Purpose                                                        |
|---------------|--------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> enable | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                    | Purpose                                                                           |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                                | Enters the global configuration mode.                                             |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br><br>Device(config)# <b>interface gigabitethernet 1/0/1</b>                | Enters interface configuration mode, and specifies the interface to configure.    |
| <b>Step 4</b> | <b>ip broadcast-address <i>ip-address</i></b><br><b>Example:</b><br><br>Device(config-if)# <b>ip broadcast-address 128.1.255.255</b> | Enters a broadcast address different from the default, for example 128.1.255.255. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                                      | Returns to privileged EXEC mode.                                                  |
| <b>Step 6</b> | <b>show ip interface [<i>interface-id</i>]</b><br><b>Example:</b><br><br>Device# <b>show ip interface</b>                            | Verifies the broadcast address on the interface or all interfaces.                |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b>                | (Optional) Saves your entries in the configuration file.                          |

## Flooding IP Broadcasts

### Procedure

|               | Command or Action                                             | Purpose                                                        |
|---------------|---------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> <b>enable</b> | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>                  | Enters the global configuration mode.                          |

|                | Command or Action                                                                                                             | Purpose                                                                |
|----------------|-------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
|                | Device# <code>configure terminal</code>                                                                                       |                                                                        |
| <b>Step 3</b>  | <b>ip forward-protocol spanning-tree</b><br><b>Example:</b><br>Device(config)# <code>ip forward-protocol spanning-tree</code> | Uses the bridging spanning-tree database to flood UDP datagrams.       |
| <b>Step 4</b>  | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                             | Returns to privileged EXEC mode.                                       |
| <b>Step 5</b>  | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                                     | Verifies your entries.                                                 |
| <b>Step 6</b>  | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code>       | (Optional) Saves your entries in the configuration file.               |
| <b>Step 7</b>  | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                       | Enters the global configuration mode.                                  |
| <b>Step 8</b>  | <b>ip forward-protocol turbo-flood</b><br><b>Example:</b><br>Device(config)# <code>ip forward-protocol turbo-flood</code>     | Uses the spanning-tree database to speed up flooding of UDP datagrams. |
| <b>Step 9</b>  | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                             | Returns to privileged EXEC mode.                                       |
| <b>Step 10</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                                     | Verifies your entries.                                                 |

|         | Command or Action                                                                                                       | Purpose                                                  |
|---------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 11 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Monitoring and Maintaining IP Addressing

When the contents of a particular cache, table, or database have become or are suspected to be invalid, you can remove all its contents by using the **clear** privileged EXEC commands. The Table lists the commands for clearing contents.

**Table 103: Commands to Clear Caches, Tables, and Databases**

|                                                             |                                                                     |
|-------------------------------------------------------------|---------------------------------------------------------------------|
| <b>clear arp-cache</b>                                      | Clears the IP ARP cache and the fast-switching cache.               |
| <b>clear host</b> { <i>name</i>   *}                        | Removes one or all entries from the hostname and the address cache. |
| <b>clear ip route</b> { <i>network</i> [ <i>mask</i> ]   *} | Removes one or more routes from the IP routing table.               |

You can display specific statistics, such as the contents of IP routing tables, caches, and databases; the reachability of nodes; and the routing path that packets are taking through the network. The Table lists the privileged EXEC commands for displaying IP statistics.

**Table 104: Commands to Display Caches, Tables, and Databases**

|                                                                              |                                                                                                                               |
|------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <b>show arp</b>                                                              | Displays the entries in the ARP table.                                                                                        |
| <b>show hosts</b>                                                            | Displays the default domain name, style of lookup service, name server hosts, and the cached list of hostnames and addresses. |
| <b>show ip aliases</b>                                                       | Displays IP addresses mapped to TCP ports (aliases).                                                                          |
| <b>show ip arp</b>                                                           | Displays the IP ARP cache.                                                                                                    |
| <b>show ip interface</b> [ <i>interface-id</i> ]                             | Displays the IP status of interfaces.                                                                                         |
| <b>show ip irdp</b>                                                          | Displays IRDP values.                                                                                                         |
| <b>show ip masks</b> <i>address</i>                                          | Displays the masks used for network addresses and the number of subnets using each mask.                                      |
| <b>show ip redirects</b>                                                     | Displays the address of a default gateway.                                                                                    |
| <b>show ip route</b> [ <i>address</i> [ <i>mask</i> ]]   [ <i>protocol</i> ] | Displays the current state of the routing table.                                                                              |

|                                    |                                                                  |
|------------------------------------|------------------------------------------------------------------|
| <code>show ip route summary</code> | Displays the current state of the routing table in summary form. |
|------------------------------------|------------------------------------------------------------------|

# How to Configure IP Unicast Routing

## Enabling IP Unicast Routing

By default, the Device is in Layer 2 switching mode and IP routing is disabled. To use the Layer 3 capabilities of the Device, you must enable IP routing.

### Procedure

|               | Command or Action                                                                         | Purpose                                                        |
|---------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                           | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>   | Enters the global configuration mode.                          |
| <b>Step 3</b> | <b>ip routing</b><br><b>Example:</b><br>Device(config)# <code>ip routing</code>           | Enables IP routing.                                            |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                         | Returns to privileged EXEC mode.                               |
| <b>Step 5</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code> | Verifies your entries.                                         |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b>                              | (Optional) Saves your entries in the configuration file.       |

|  | Command or Action                                       | Purpose |
|--|---------------------------------------------------------|---------|
|  | Device# <code>copy running-config startup-config</code> |         |

## Example of Enabling IP Routing

This example shows how to enable IP routing using RIP as the routing protocol :

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ip routing
Device(config)# router rip
Device(config-router)# network 10.0.0.0
Device(config-router)# end
```

## What to Do Next

You can now set up parameters for the selected routing protocols as described in these sections:

- RIP
- OSPF,
- EIGRP
- BGP
- Unicast Reverse Path Forwarding
- Protocol-Independent Features (optional)

## Information About RIP

The Routing Information Protocol (RIP) is an interior gateway protocol (IGP) created for use in small, homogeneous networks. It is a distance-vector routing protocol that uses broadcast User Datagram Protocol (UDP) data packets to exchange routing information. The protocol is documented in RFC 1058. You can find detailed information about RIP in *IP Routing Fundamentals*, published by Cisco Press.

**Note** RIP is supported in the IP Base .

Using RIP, the Device sends routing information updates (advertisements) every 30 seconds. If a router does not receive an update from another router for 180 seconds or more, it marks the routes served by that router as unusable. If there is still no update after 240 seconds, the router removes all routing table entries for the non-updating router.

RIP uses hop counts to rate the value of different routes. The hop count is the number of routers that can be traversed in a route. A directly connected network has a hop count of zero; a network with a hop count of 16 is unreachable. This small range (0 to 15) makes RIP unsuitable for large networks.

If the router has a default network path, RIP advertises a route that links the router to the pseudonetwork 0.0.0.0. The 0.0.0.0 network does not exist; it is treated by RIP as a network to implement the default routing feature. The Device advertises the default network if a default was learned by RIP or if the router has a gateway of last resort and RIP is configured with a default metric. RIP sends updates to the interfaces in specified networks. If an interface's network is not specified, it is not advertised in any RIP update.

## Summary Addresses and Split Horizon

Routers connected to broadcast-type IP networks and using distance-vector routing protocols normally use the split-horizon mechanism to reduce the possibility of routing loops. Split horizon blocks information about routes from being advertised by a router on any interface from which that information originated. This feature usually optimizes communication among multiple routers, especially when links are broken.

# How to Configure RIP

## Default RIP Configuration

*Table 105: Default RIP Configuration*

| Feature                         | Default Setting                                                                                                                                                            |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto summary                    | Enabled.                                                                                                                                                                   |
| Default-information originate   | Disabled.                                                                                                                                                                  |
| Default metric                  | Built-in; automatic metric translations.                                                                                                                                   |
| IP RIP authentication key-chain | No authentication.<br>Authentication mode: clear text.                                                                                                                     |
| IP RIP triggered                | Disabled                                                                                                                                                                   |
| IP split horizon                | Varies with media.                                                                                                                                                         |
| Neighbor                        | None defined.                                                                                                                                                              |
| Network                         | None specified.                                                                                                                                                            |
| Offset list                     | Disabled.                                                                                                                                                                  |
| Output delay                    | 0 milliseconds.                                                                                                                                                            |
| Timers basic                    | <ul style="list-style-type: none"> <li>• Update: 30 seconds.</li> <li>• Invalid: 180 seconds.</li> <li>• Hold-down: 180 seconds.</li> <li>• Flush: 240 seconds.</li> </ul> |

| Feature                | Default Setting                                                |
|------------------------|----------------------------------------------------------------|
| Validate-update-source | Enabled.                                                       |
| Version                | Receives RIP Version 1 and 2 packets; sends Version 1 packets. |

## Configuring Basic RIP Parameters

To configure RIP, you enable RIP routing for a network and optionally configure other parameters. On the Device, RIP configuration commands are ignored until you configure the network number.

### Procedure

|               | Command or Action                                                                                | Purpose                                                                                                                                                                                                                                                                             |
|---------------|--------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                        | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                      |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                | Enters the global configuration mode.                                                                                                                                                                                                                                               |
| <b>Step 3</b> | <b>ip routing</b><br><b>Example:</b><br>Device(config)# <b>ip routing</b>                        | Enables IP routing. (Required only if IP routing is disabled.)                                                                                                                                                                                                                      |
| <b>Step 4</b> | <b>router rip</b><br><b>Example:</b><br>Device(config)# <b>router rip</b>                        | Enables a RIP routing process, and enter router configuration mode.                                                                                                                                                                                                                 |
| <b>Step 5</b> | <b>network <i>network number</i></b><br><b>Example:</b><br>Device(config)# <b>network 12</b>     | Associates a network with a RIP routing process. You can specify multiple <b>network</b> commands. RIP routing updates are sent and received through interfaces only on these networks.<br><br><b>Note</b> You must configure a network number for the RIP commands to take effect. |
| <b>Step 6</b> | <b>neighbor <i>ip-address</i></b><br><b>Example:</b><br>Device(config)# <b>neighbor 10.2.5.1</b> | (Optional) Defines a neighboring router with which to exchange routing information. This step allows routing updates from RIP (normally a broadcast protocol) to reach nonbroadcast networks.                                                                                       |

|         | Command or Action                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7  | <p><b>offset-list</b> [<i>access-list number   name</i>] {<b>in</b>   <b>out</b>} <i>offset</i> [<i>type number</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# offset-list 103 in 10</pre> | (Optional) Applies an offset list to routing metrics to increase incoming and outgoing metrics to routes learned through RIP. You can limit the offset list with an access list or an interface.                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 8  | <p><b>timers basic</b> <i>update invalid holddown flush</i></p> <p><b>Example:</b></p> <pre>Device(config)# timers basic 45 360 400 300</pre>                                                    | <p>(Optional) Adjusts routing protocol timers. Valid ranges for all timers are 0 to 4294967295 seconds.</p> <ul style="list-style-type: none"> <li>• <i>update</i>—The time between sending routing updates. The default is 30 seconds.</li> <li>• <i>invalid</i>—The timer after which a route is declared invalid. The default is 180 seconds.</li> <li>• <i>holddown</i>—The time before a route is removed from the routing table. The default is 180 seconds.</li> <li>• <i>flush</i>—The amount of time for which routing updates are postponed. The default is 240 seconds.</li> </ul> |
| Step 9  | <p><b>version</b> {<b>1</b>   <b>2</b>}</p> <p><b>Example:</b></p> <pre>Device(config)# version 2</pre>                                                                                          | (Optional) Configures the switch to receive and send only RIP Version 1 or RIP Version 2 packets. By default, the switch receives Version 1 and 2 but sends only Version 1. You can also use the interface commands <b>ip rip {send   receive} version 1   2   1 2}</b> to control what versions are used for sending and receiving on interfaces.                                                                                                                                                                                                                                            |
| Step 10 | <p><b>no auto summary</b></p> <p><b>Example:</b></p> <pre>Device(config)# no auto summary</pre>                                                                                                  | (Optional) Disables automatic summarization. By default, the switch summarizes subprefixes when crossing classful network boundaries. Disable summarization (RIP Version 2 only) to advertise subnet and host routing information to classful network boundaries.                                                                                                                                                                                                                                                                                                                             |
| Step 11 | <p><b>no validate-update-source</b></p> <p><b>Example:</b></p> <pre>Device(config)# no validdate-update-source</pre>                                                                             | (Optional) Disables validation of the source IP address of incoming RIP routing updates. By default, the switch validates the source IP address of incoming RIP routing updates and discards the update if the source address is not valid. Under normal circumstances, disabling this feature is not recommended. However, if you have a router that is off-network and you want to receive its updates, you can use this command.                                                                                                                                                           |
| Step 12 | <p><b>output-delay</b> <i>delay</i></p> <p><b>Example:</b></p> <pre>Device(config)# output-delay 8</pre>                                                                                         | (Optional) Adds interpacket delay for RIP updates sent. By default, packets in a multiple-packet RIP update have no delay added between packets. If you are sending packets to a lower-speed device, you can add an interpacket delay in the range of 8 to 50 milliseconds.                                                                                                                                                                                                                                                                                                                   |
| Step 13 | <p><b>end</b></p> <p><b>Example:</b></p>                                                                                                                                                         | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                | Command or Action                                                                                                 | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | Device(config)# <b>end</b>                                                                                        |                                                          |
| <b>Step 14</b> | <b>show ip protocols</b><br><b>Example:</b><br>Device# <b>show ip protocols</b>                                   | Verifies your entries.                                   |
| <b>Step 15</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Configuring RIP Authentication

RIP Version 1 does not support authentication. If you are sending and receiving RIP Version 2 packets, you can enable RIP authentication on an interface. The key chain specifies the set of keys that can be used on the interface. If a key chain is not configured, no authentication is performed, not even the default.

The Device supports two modes of authentication on interfaces for which RIP authentication is enabled: plain text and MD5. The default is plain text.

### Procedure

|               | Command or Action                                                                                                 | Purpose                                                                        |
|---------------|-------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                         | Enables privileged EXEC mode. Enter your password if prompted.                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                 | Enters the global configuration mode.                                          |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet 1/0/1</b> | Enters interface configuration mode, and specifies the interface to configure. |
| <b>Step 4</b> | <b>ip rip authentication key-chain <i>name-of-chain</i></b><br><b>Example:</b>                                    | Enables RIP authentication.                                                    |

|               | Command or Action                                                                                                                    | Purpose                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
|               | Device(config-if) # <code>ip rip authentication key-chain trees</code>                                                               |                                                                                                       |
| <b>Step 5</b> | <b>ip rip authentication mode {text   md5}</b><br><b>Example:</b><br>Device(config-if) # <code>ip rip authentication mode md5</code> | Configures the interface to use plain text authentication (the default) or MD5 digest authentication. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config) # <code>end</code>                                                                   | Returns to privileged EXEC mode.                                                                      |
| <b>Step 7</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                                            | Verifies your entries.                                                                                |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code>              | (Optional) Saves your entries in the configuration file.                                              |

## Configuring Summary Addresses and Split Horizon

**Note** In general, disabling split horizon is not recommended unless you are certain that your application requires it to properly advertise routes.

If you want to configure an interface running RIP to advertise a summarized local IP address pool on a network access server for dial-up clients, use the **ip summary-address rip** interface configuration command.

**Note** If split horizon is enabled, neither autosummary nor interface IP summary addresses are advertised.

### Procedure

|               | Command or Action                | Purpose                                                        |
|---------------|----------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                                                         | Purpose                                                                                |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
|               | Device> <b>enable</b>                                                                                                                                                     |                                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                         | Enters the global configuration mode.                                                  |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet 1/0/1</b>                                                         | Enters interface configuration mode, and specifies the Layer 3 interface to configure. |
| <b>Step 4</b> | <b>ip address <i>ip-address subnet-mask</i></b><br><b>Example:</b><br>Device(config-if)# <b>ip address 10.1.1.10 255.255.255.0</b>                                        | Configures the IP address and IP subnet.                                               |
| <b>Step 5</b> | <b>ip summary-address rip ip address <i>ip-network mask</i></b><br><b>Example:</b><br>Device(config-if)# <b>ip summary-address rip ip address 10.1.1.30 255.255.255.0</b> | Configures the IP address to be summarized and the IP network mask.                    |
| <b>Step 6</b> | <b>no ip split horizon</b><br><b>Example:</b><br>Device(config-if)# <b>no ip split horizon</b>                                                                            | Disables split horizon on the interface.                                               |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                               | Returns to privileged EXEC mode.                                                       |
| <b>Step 8</b> | <b>show ip interface <i>interface-id</i></b><br><b>Example:</b><br>Device# <b>show ip interface gigabitethernet 1/0/1</b>                                                 | Verifies your entries.                                                                 |
| <b>Step 9</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                                                         | (Optional) Saves your entries in the configuration file.                               |

## Configuring Split Horizon

Routers connected to broadcast-type IP networks and using distance-vector routing protocols normally use the split-horizon mechanism to reduce the possibility of routing loops. Split horizon blocks information about routes from being advertised by a router on any interface from which that information originated. This feature can optimize communication among multiple routers, especially when links are broken.

**Note** In general, we do not recommend disabling split horizon unless you are certain that your application requires it to properly advertise routes.

### Procedure

|               | Command or Action                                                                                                                     | Purpose                                                                        |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                             | Enables privileged EXEC mode. Enter your password if prompted.                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                     | Enters the global configuration mode.                                          |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface</b> gigabitethernet 1/0/1                     | Enters interface configuration mode, and specifies the interface to configure. |
| <b>Step 4</b> | <b>ip address</b> <i>ip-address subnet-mask</i><br><b>Example:</b><br>Device(config-if)# <b>ip address</b> 10.1.1.10<br>255.255.255.0 | Configures the IP address and IP subnet.                                       |
| <b>Step 5</b> | <b>no ip split-horizon</b><br><b>Example:</b><br>Device(config-if)# <b>no ip split-horizon</b>                                        | Disables split horizon on the interface.                                       |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                           | Returns to privileged EXEC mode.                                               |

|        | Command or Action                                                                                                  | Purpose                                                  |
|--------|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 7 | <b>show ip interface <i>interface-id</i></b><br><b>Example:</b><br>Device# show ip interface gigabitethernet 1/0/1 | Verifies your entries.                                   |
| Step 8 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config         | (Optional) Saves your entries in the configuration file. |

## Configuration Example for Summary Addresses and Split Horizon

In this example, the major net is 10.0.0.0. The summary address 10.2.0.0 overrides the autosummary address of 10.0.0.0 so that 10.2.0.0 is advertised out interface Gigabit Ethernet port 2, and 10.0.0.0 is not advertised. In the example, if the interface is still in Layer 2 mode (the default), you must enter a **no switchport** interface configuration command before entering the **ip address** interface configuration command.

**Note** If split horizon is enabled, neither autosummary nor interface summary addresses (those configured with the **ip summary-address rip** router configuration command) are advertised.

```
Device(config)# router rip
Device(config-router)# interface gigabitethernet1/0/2
Device(config-if)# ip address 10.1.5.1 255.255.255.0
Device(config-if)# ip summary-address rip 10.2.0.0 255.255.0.0
Device(config-if)# no ip split-horizon
Device(config-if)# exit
Device(config)# router rip
Device(config-router)# network 10.0.0.0
Device(config-router)# neighbor 2.2.2.2 peer-group mygroup
Device(config-router)# end
```

## Information About OSPF

OSPF is an Interior Gateway Protocol (IGP) designed expressly for IP networks, supporting IP subnetting and tagging of externally derived routing information. OSPF also allows packet authentication and uses IP multicast when sending and receiving packets. The Cisco implementation supports RFC 1253, OSPF management information base (MIB).

**Note** OSPF is supported in IP Base.

The Cisco implementation conforms to the OSPF Version 2 specifications with these key features:

- Definition of stub areas is supported.
- Routes learned through any IP routing protocol can be redistributed into another IP routing protocol. At the intradomain level, this means that OSPF can import routes learned through EIGRP and RIP. OSPF routes can also be exported into RIP.
- Plain text and MD5 authentication among neighboring routers within an area is supported.
- Configurable routing interface parameters include interface output cost, retransmission interval, interface transmit delay, router priority, router dead and hello intervals, and authentication key.
- Virtual links are supported.
- Not-so-stubby-areas (NSSAs) per RFC 1587 are supported.

OSPF typically requires coordination among many internal routers, area border routers (ABRs) connected to multiple areas, and autonomous system boundary routers (ASBRs). The minimum configuration would use all default parameter values, no authentication, and interfaces assigned to areas. If you customize your environment, you must ensure coordinated configuration of all routers.

## OSPF Nonstop Forwarding

The Device or switch stack supports two levels of nonstop forwarding (NSF):

- [OSPF NSF Awareness, on page 1383](#)
- [OSPF NSF Capability, on page 1383](#)

### OSPF NSF Awareness

The IP-services feature set supports OSPF NSF Awareness supported for IPv4. When the neighboring router is NSF-capable, the Layer 3 Device continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router crashing and the backup RP taking over, or while the primary RP is manually reloaded for a non-disruptive software upgrade.

This feature cannot be disabled.

### OSPF NSF Capability

The IP services feature set supports the OSPFv2 NSF IETF format in addition to the OSPFv2 NSF Cisco format that is supported in earlier releases. For information about this feature, see : *NSF—OSPF (RFC 3623 OSPF Graceful Restart)*.

The IP-services feature set also supports OSPF NSF-capable routing for IPv4 for better convergence and lower traffic loss following a stack master change. When a stack master change occurs in an OSPF NSF-capable stack, the new stack master must do two things to resynchronize its link-state database with its OSPF neighbors:

- Release the available OSPF neighbors on the network without resetting the neighbor relationship.
- Reacquire the contents of the link-state database for the network.

After a stack master change, the new master sends an OSPF NSF signal to neighboring NSF-aware devices. A device recognizes this signal to mean that it should not reset the neighbor relationship with the stack. As the NSF-capable stack master receives signals from other routes on the network, it begins to rebuild its neighbor list.

When the neighbor relationships are reestablished, the NSF-capable stack master resynchronizes its database with its NSF-aware neighbors, and routing information is exchanged between the OSPF neighbors. The new stack master uses this routing information to remove stale routes, to update the routing information database (RIB), and to update the forwarding information base (FIB) with the new information. The OSPF protocols then fully converge.

**Note** OSPF NSF requires that all neighbor networking devices be NSF-aware. If an NSF-capable router discovers non-NSF aware neighbors on a network segment, it disables NSF capabilities for that segment. Other network segments where all devices are NSF-aware or NSF-capable continue to provide NSF capabilities.

Use the **nsf** OSPF routing configuration command to enable OSPF NSF routing. Use the **show ip ospf** privileged EXEC command to verify that it is enabled.

For more information, see *Cisco Nonstop Forwarding*:

[http://www.cisco.com/en/US/docs/ios/ha/configuration/guide/ha-nonstp\\_fwdg.html](http://www.cisco.com/en/US/docs/ios/ha/configuration/guide/ha-nonstp_fwdg.html)

## OSPF Area Parameters

You can optionally configure several OSPF area parameters. These parameters include authentication for password-based protection against unauthorized access to an area, stub areas, and not-so-stubby-areas (NSSAs). Stub areas are areas into which information on external routes is not sent. Instead, the area border router (ABR) generates a default external route into the stub area for destinations outside the autonomous system (AS). An NSSA does not flood all LSAs from the core into the area, but can import AS external routes within the area by redistribution.

Route summarization is the consolidation of advertised addresses into a single summary route to be advertised by other areas. If network numbers are contiguous, you can use the **area range** router configuration command to configure the ABR to advertise a summary route that covers all networks in the range.

## Other OSPF Parameters

You can optionally configure other OSPF parameters in router configuration mode.

- **Route summarization:** When redistributing routes from other protocols. Each route is advertised individually in an external LSA. To help decrease the size of the OSPF link state database, you can use the **summary-address** router configuration command to advertise a single router for all the redistributed routes included in a specified network address and mask.
- **Virtual links:** In OSPF, all areas must be connected to a backbone area. You can establish a virtual link in case of a backbone-continuity break by configuring two Area Border Routers as endpoints of a virtual link. Configuration information includes the identity of the other virtual endpoint (the other ABR) and the nonbackbone link that the two routers have in common (the transit area). Virtual links cannot be configured through a stub area.
- **Default route:** When you specifically configure redistribution of routes into an OSPF routing domain, the route automatically becomes an autonomous system boundary router (ASBR). You can force the ASBR to generate a default route into the OSPF routing domain.
- **Domain Name Server (DNS) names for use in all OSPF show** privileged EXEC command displays makes it easier to identify a router than displaying it by router ID or neighbor ID.

- **Default Metrics:** OSPF calculates the OSPF metric for an interface according to the bandwidth of the interface. The metric is calculated as  $ref-bw$  divided by bandwidth, where  $ref$  is 10 by default, and bandwidth ( $bw$ ) is specified by the **bandwidth** interface configuration command. For multiple links with high bandwidth, you can specify a larger number to differentiate the cost on those links.
- **Administrative distance** is a rating of the trustworthiness of a routing information source, an integer between 0 and 255, with a higher value meaning a lower trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored. OSPF uses three different administrative distances: routes within an area (interarea), routes to another area (interarea), and routes from another routing domain learned through redistribution (external). You can change any of the distance values.
- **Passive interfaces:** Because interfaces between two devices on an Ethernet represent only one network segment, to prevent OSPF from sending hello packets for the sending interface, you must configure the sending device to be a passive interface. Both devices can identify each other through the hello packet for the receiving interface.
- **Route calculation timers:** You can configure the delay time between when OSPF receives a topology change and when it starts the shortest path first (SPF) calculation and the hold time between two SPF calculations.
- **Log neighbor changes:** You can configure the router to send a syslog message when an OSPF neighbor state changes, providing a high-level view of changes in the router.

## LSA Group Pacing

The OSPF LSA group pacing feature allows the router to group OSPF LSAs and pace the refreshing, check-summing, and aging functions for more efficient router use. This feature is enabled by default with a 4-minute default pacing interval, and you will not usually need to modify this parameter. The optimum group pacing interval is inversely proportional to the number of LSAs the router is refreshing, check-summing, and aging. For example, if you have approximately 10,000 LSAs in the database, decreasing the pacing interval would benefit you. If you have a very small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might benefit you slightly.

## Loopback Interfaces

OSPF uses the highest IP address configured on the interfaces as its router ID. If this interface is down or removed, the OSPF process must recalculate a new router ID and resend all its routing information out its interfaces. If a loopback interface is configured with an IP address, OSPF uses this IP address as its router ID, even if other interfaces have higher IP addresses. Because loopback interfaces never fail, this provides greater stability. OSPF automatically prefers a loopback interface over other interfaces, and it chooses the highest IP address among all loopback interfaces.

# How to Configure OSPF

## Default OSPF Configuration

*Table 106: Default OSPF Configuration*

| Feature                       | Default Setting                                                                                                                                                                                                                                       |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface parameters          | Cost: 1.<br>Retransmit interval: 5 seconds.<br>Transmit delay: 1 second.<br>Priority: 1.<br>Hello interval: 10 seconds.<br>Dead interval: 4 times the hello interval.<br>No authentication.<br>No password specified.<br>MD5 authentication disabled. |
| Area                          | Authentication type: 0 (no authentication).<br>Default cost: 1.<br>Range: Disabled.<br>Stub: No stub area defined.<br>NSSA: No NSSA area defined.                                                                                                     |
| Auto cost                     | 100 Mb/s.                                                                                                                                                                                                                                             |
| Default-information originate | Disabled. When enabled, the default metric setting is 10, and the external route type default is Type 2.                                                                                                                                              |
| Default metric                | Built-in, automatic metric translation, as appropriate for each routing protocol.                                                                                                                                                                     |
| Distance OSPF                 | dist1 (all routes within an area): 110. dist2 (all routes from one area to another): 110. and dist3 (routes from other routing domains): 110.                                                                                                         |
| OSPF database filter          | Disabled. All outgoing link-state advertisements (LSAs) are flooded to the interface.                                                                                                                                                                 |
| IP OSPF name lookup           | Disabled.                                                                                                                                                                                                                                             |
| Log adjacency changes         | Enabled.                                                                                                                                                                                                                                              |
| Neighbor                      | None specified.                                                                                                                                                                                                                                       |

| Feature                            | Default Setting                                                                                                                                                                                                                                         |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Neighbor database filter           | Disabled. All outgoing LSAs are flooded to the neighbor.                                                                                                                                                                                                |
| Network area                       | Disabled.                                                                                                                                                                                                                                               |
| Nonstop Forwarding (NSF) awareness | Enabled. Allows Layer 3 switches to continue forwarding packets from a neighboring NSF-capable router during hardware or software changes.                                                                                                              |
| NSF capability                     | Disabled.<br><b>Note</b> The switch stack supports OSPF NSF-capable routing for IPv4.                                                                                                                                                                   |
| Router ID                          | No OSPF routing process defined.                                                                                                                                                                                                                        |
| Summary address                    | Disabled.                                                                                                                                                                                                                                               |
| Timers LSA group pacing            | 240 seconds.                                                                                                                                                                                                                                            |

## Configuring Basic OSPF Parameters

To enable OSPF, create an OSPF routing process, specify the range of IP addresses to associate with the routing process, and assign area IDs to be associated with that range. For switches running the IP services image, you can configure either the Cisco OSPFv2 NSF format or the IETF OSPFv2 NSF format.

### Procedure

|        | Command or Action                                                                               | Purpose                               |
|--------|-------------------------------------------------------------------------------------------------|---------------------------------------|
| Step 1 | <b>configure terminal</b><br><br><b>Example:</b><br><br>Device# <code>configure terminal</code> | Enters the global configuration mode. |

|               | Command or Action                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 2</b> | <p><b>router ospf</b> process-id</p> <p><b>Example:</b></p> <pre>Device(config)# router ospf 15</pre>                                           | <p>Enables OSPF routing, and enter router configuration mode. The process ID is an internally used identification parameter that is locally assigned and can be any positive integer. Each OSPF routing process has a unique value.</p> <p><b>Note</b> OSPF for Routed Access supports only one OSPFv2 and one OSPFv3 instance with a maximum number of 200 dynamically learned routes.</p> |
| <b>Step 3</b> | <p><b>nsf cisco</b> [enforce global]</p> <p><b>Example:</b></p> <pre>Device(config)# nsf cisco enforce global</pre>                             | <p>(Optional) Enables Cisco NSF operations for OSPF. The <b>enforce global</b> keyword cancels NSF restart when non-NSF-aware neighboring networking devices are detected.</p> <p><b>Note</b> Enter the command in Step 3 or Step 4, and go to Step 5.</p>                                                                                                                                  |
| <b>Step 4</b> | <p><b>nsf ietf</b> [restart-interval <i>seconds</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# nsf ietf restart-interval 60</pre>         | <p>(Optional) Enables IETF NSF operations for OSPF. The <b>restart-interval</b> keyword specifies the length of the graceful restart interval, in seconds. The range is from 1 to 1800. The default is 120.</p> <p><b>Note</b> Enter the command in Step 3 or Step 4, and go to Step 5.</p>                                                                                                 |
| <b>Step 5</b> | <p><b>network</b> address wildcard-mask area area-id</p> <p><b>Example:</b></p> <pre>Device(config)# network 10.1.1.1 255.240.0.0 area 20</pre> | <p>Define an interface on which OSPF runs and the area ID for that interface. You can use the wildcard-mask to use a single command to define one or more multiple interfaces to be associated with a specific OSPF area. The area ID can be a decimal value or an IP address.</p>                                                                                                          |
| <b>Step 6</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                         | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b> | <p><b>show ip protocols</b></p> <p><b>Example:</b></p> <pre>Device# show ip protocols</pre>                                                     | <p>Verifies your entries.</p>                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 8</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                   | <p>(Optional) Saves your entries in the configuration file.</p>                                                                                                                                                                                                                                                                                                                             |

## Configuring OSPF Interfaces

You can use the **ip ospf** interface configuration commands to modify interface-specific OSPF parameters. You are not required to modify any of these parameters, but some interface parameters (hello interval, dead interval, and authentication key) must be consistent across all routers in an attached network. If you modify these parameters, be sure all routers in the network have compatible values.

**Note** The **ip ospf** interface configuration commands are all optional.

### Procedure

|               | Command or Action                                                                                                       | Purpose                                                                                                                                                                                                   |
|---------------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                       | Enters the global configuration mode.                                                                                                                                                                     |
| <b>Step 2</b> | <b>interface interface-id</b><br><b>Example:</b><br>Device(config)# <b>interface gigabitethernet 1/0/1</b>              | Enters interface configuration mode, and specifies the Layer 3 interface to configure.                                                                                                                    |
| <b>Step 3</b> | <b>ip ospf cost</b><br><b>Example:</b><br>Device(config-if)# <b>ip ospf 8</b>                                           | (Optional) Explicitly specifies the cost of sending a packet on the interface.                                                                                                                            |
| <b>Step 4</b> | <b>ip ospf retransmit-interval seconds</b><br><b>Example:</b><br>Device(config-if)# <b>ip ospf transmit-interval 10</b> | (Optional) Specifies the number of seconds between link state advertisement transmissions. The range is 1 to 65535 seconds. The default is 5 seconds.                                                     |
| <b>Step 5</b> | <b>ip ospf transmit-delay seconds</b><br><b>Example:</b><br>Device(config-if)# <b>ip ospf transmit-delay 2</b>          | (Optional) Sets the estimated number of seconds to wait before sending a link state update packet. The range is 1 to 65535 seconds. The default is 1 second.                                              |
| <b>Step 6</b> | <b>ip ospf priority number</b><br><b>Example:</b><br>Device(config-if)# <b>ip ospf priority 5</b>                       | (Optional) Sets priority to help find the OSPF designated router for a network. The range is from 0 to 255. The default is 1.                                                                             |
| <b>Step 7</b> | <b>ip ospf hello-interval seconds</b><br><b>Example:</b>                                                                | (Optional) Sets the number of seconds between hello packets sent on an OSPF interface. The value must be the same for all nodes on a network. The range is 1 to 65535 seconds. The default is 10 seconds. |

|                | Command or Action                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Device(config-if)# ip ospf hello-interval 12                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 8</b>  | <p><b>ip ospf dead-interval</b> seconds</p> <p><b>Example:</b></p> <pre>Device(config-if)# ip ospf dead-interval 8</pre>                                | (Optional) Sets the number of seconds after the last device hello packet was seen before its neighbors declare the OSPF router to be down. The value must be the same for all nodes on a network. The range is 1 to 65535 seconds. The default is 4 times the hello interval.                                                                                       |
| <b>Step 9</b>  | <p><b>ip ospf authentication-key</b> key</p> <p><b>Example:</b></p> <pre>Device(config-if)# ip ospf authentication-key password</pre>                   | (Optional) Assign a password to be used by neighboring OSPF routers. The password can be any string of keyboard-entered characters up to 8 bytes in length. All neighboring routers on the same network must have the same password to exchange OSPF information.                                                                                                   |
| <b>Step 10</b> | <p><b>ip ospf message digest-key</b> keyid md5 key</p> <p><b>Example:</b></p> <pre>Device(config-if)# ip ospf message digest-key 16 md5 yourlpass</pre> | (Optional) Enables MDS authentication. <ul style="list-style-type: none"> <li>• <i>keyid</i>—An identifier from 1 to 255.</li> <li>• <i>key</i>—An alphanumeric password of up to 16 bytes.</li> </ul>                                                                                                                                                              |
| <b>Step 11</b> | <p><b>ip ospf database-filter all out</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# ip ospf database-filter all out</pre>                      | (Optional) Block flooding of OSPF LSA packets to the interface. By default, OSPF floods new LSAs over all interfaces in the same area, except the interface on which the LSA arrives.                                                                                                                                                                               |
| <b>Step 12</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                 | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 13</b> | <p><b>show ip ospf interface</b> [interface-name]</p> <p><b>Example:</b></p> <pre>Device# show ip ospf interface</pre>                                  | Displays OSPF-related interface information.                                                                                                                                                                                                                                                                                                                        |
| <b>Step 14</b> | <p><b>show ip ospf neighbor detail</b></p> <p><b>Example:</b></p> <pre>Device# show ip ospf neighbor detail</pre>                                       | Displays NSF awareness status of neighbor switch. The output matches one of these examples: <ul style="list-style-type: none"> <li>• <i>Options is 0x52</i><br/><i>LLS Options is 0x1 (LR)</i><br/>When both of these lines appear, the neighbor switch is NSF aware.</li> <li>• <i>Options is 0x42</i>—This means the neighbor switch is not NSF aware.</li> </ul> |

|                | Command or Action                                                                                                       | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 15</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring OSPF Area Parameters

### Before you begin

**Note** The OSPF **area** router configuration commands are all optional.

### Procedure

|               | Command or Action                                                                                                                                | Purpose                                                                                                                                                       |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                          | Enters the global configuration mode.                                                                                                                         |
| <b>Step 2</b> | <b>router ospf process-id</b><br><b>Example:</b><br>Device(config)# <code>router ospf 109</code>                                                 | Enables OSPF routing, and enter router configuration mode.                                                                                                    |
| <b>Step 3</b> | <b>area area-id authentication</b><br><b>Example:</b><br>Device(config-router)# <code>area 1 authentication</code>                               | (Optional) Allow password-based protection against unauthorized access to the identified area. The identifier can be either a decimal value or an IP address. |
| <b>Step 4</b> | <b>area area-id authentication message-digest</b><br><b>Example:</b><br>Device(config-router)# <code>area 1 authentication message-digest</code> | (Optional) Enables MD5 authentication on the area.                                                                                                            |
| <b>Step 5</b> | <b>area area-id stub [no-summary]</b><br><b>Example:</b><br>Device(config-router)# <code>area 1 stub</code>                                      | (Optional) Define an area as a stub area. The <b>no-summary</b> keyword prevents an ABR from sending summary link advertisements into the stub area.          |

|                | Command or Action                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 6</b>  | <p><b>area</b> <i>area-id</i> <b>nssa</b> [<b>no-redistribution</b>] [<b>default-information-originate</b>] [<b>no-summary</b>]</p> <p><b>Example:</b></p> <pre>Device(config-router)# area 1 nssa default-information-originate</pre> | <p>(Optional) Defines an area as a not-so-stubby-area. Every router within the same area must agree that the area is NSSA. Select one of these keywords:</p> <ul style="list-style-type: none"> <li>• <b>no-redistribution</b>—Select when the router is an NSSA ABR and you want the <b>redistribute</b> command to import routes into normal areas, but not into the NSSA.</li> <li>• <b>default-information-originate</b>—Select on an ABR to allow importing type 7 LSAs into the NSSA.</li> <li>• <b>no-redistribution</b>—Select to not send summary LSAs into the NSSA.</li> </ul> |
| <b>Step 7</b>  | <p><b>area</b> <i>area-id</i> <b>range</b> <i>address mask</i></p> <p><b>Example:</b></p> <pre>Device(config-router)# area 1 range 255.240.0.0</pre>                                                                                   | <p>(Optional) Specifies an address range for which a single route is advertised. Use this command only with area border routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 8</b>  | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                                                                                | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 9</b>  | <p><b>show ip ospf</b> [<i>process-id</i>]</p> <p><b>Example:</b></p> <pre>Device# show ip ospf</pre>                                                                                                                                  | <p>Displays information about the OSPF routing process in general or for a specific process ID to verify configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 10</b> | <p><b>show ip ospf</b> [<i>process-id</i> [<i>area-id</i>]] <b>database</b></p> <p><b>Example:</b></p> <pre>Device# show ip ospf database</pre>                                                                                        | <p>Displays lists of information related to the OSPF database for a specific router.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 11</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                                                                                          | <p>(Optional) Saves your entries in the configuration file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Configuring Other OSPF Parameters

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                        | Purpose                                                                                                                            |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                                        | Enters the global configuration mode.                                                                                              |
| <b>Step 2</b> | <b>router ospf process-id</b><br><b>Example:</b><br>Device(config)# <b>router ospf 10</b>                                                                                                                                                                                | Enables OSPF routing, and enter router configuration mode.                                                                         |
| <b>Step 3</b> | <b>summary-address address mask</b><br><b>Example:</b><br>Device(config)# <b>summary-address 10.1.1.1 255.255.255.0</b>                                                                                                                                                  | (Optional) Specifies an address and IP subnet mask for redistributed routes so that only one summary route is advertised.          |
| <b>Step 4</b> | <b>area area-id virtual-link router-id [hello-interval seconds] [retransmit-interval seconds] [trans] [[authentication-key key]   message-digest-key keyid md5 key]]</b><br><b>Example:</b><br>Device(config)# <b>area 2 virtual-link 192.168.255.1 hello-interval 5</b> | (Optional) Establishes a virtual link and set its parameters.                                                                      |
| <b>Step 5</b> | <b>default-information originate [always] [metric metric-value] [metric-type type-value] [route-map map-name]</b><br><b>Example:</b><br>Device(config)# <b>default-information originate metric 100 metric-type 1</b>                                                    | (Optional) Forces the ASBR to generate a default route into the OSPF routing domain. Parameters are all optional.                  |
| <b>Step 6</b> | <b>ip ospf name-lookup</b><br><b>Example:</b><br>Device(config)# <b>ip ospf name-lookup</b>                                                                                                                                                                              | (Optional) Configures DNS name lookup. The default is disabled.                                                                    |
| <b>Step 7</b> | <b>ip auto-cost reference-bandwidth ref-bw</b><br><b>Example:</b><br>Device(config)# <b>ip auto-cost reference-bandwidth 5</b>                                                                                                                                           | (Optional) Specifies an address range for which a single route will be advertised. Use this command only with area border routers. |

|                | Command or Action                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 8</b>  | <b>distance ospf</b> {[inter-area <i>dist1</i> ] [inter-area <i>dist2</i> ] [external <i>dist3</i> ]}<br><b>Example:</b><br><pre>Device(config)# distance ospf inter-area 150</pre> | (Optional) Changes the OSPF distance values. The default distance for each type of route is 110. The range is 1 to 255.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 9</b>  | <b>passive-interface</b> <i>type number</i><br><b>Example:</b><br><pre>Device(config)# passive-interface gigabitethernet 1/0/6</pre>                                                | (Optional) Suppresses the sending of hello packets through the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 10</b> | <b>timers throttle spf</b> <i>spf-delay spf-holdtime spf-wait</i><br><b>Example:</b><br><pre>Device(config)# timers throttle spf 200 100 100</pre>                                  | (Optional) Configures route calculation timers. <ul style="list-style-type: none"> <li>• <i>spf-delay</i>—Delay between receiving a change to SPF calculation. The range is from 1 to 600000 milliseconds.</li> <li>• <i>spf-holdtime</i>—Delay between first and second SPF calculation. The range is form 1 to 600000 in milliseconds.</li> <li>• <i>spf-wait</i>—Maximum wait time in milliseconds for SPF calculations. The range is from 1 to 600000 in milliseconds.</li> </ul> |
| <b>Step 11</b> | <b>ospf log-adj-changes</b><br><b>Example:</b><br><pre>Device(config)# ospf log-adj-changes</pre>                                                                                   | (Optional) Sends syslog message when a neighbor state changes.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 12</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                                                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 13</b> | <b>show ip ospf</b> [ <i>process-id</i> [ <i>area-id</i> ]] <b>database</b><br><b>Example:</b><br><pre>Device# show ip ospf database</pre>                                          | Displays lists of information related to the OSPF database for a specific router.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 14</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre>                                                               | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Changing LSA Group Pacing

### Procedure

|               | Command or Action                                                                                                                      | Purpose                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <code>configure terminal</code>                                            | Enters the global configuration mode.                      |
| <b>Step 2</b> | <b>router ospf <i>process-id</i></b><br><b>Example:</b><br><br>Device(config)# <code>router ospf 25</code>                             | Enables OSPF routing, and enter router configuration mode. |
| <b>Step 3</b> | <b>timers lsa-group-pacing <i>seconds</i></b><br><b>Example:</b><br><br>Device(config-router)# <code>timers lsa-group-pacing 15</code> | Changes the group pacing of LSAs.                          |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <code>end</code>                                                                  | Returns to privileged EXEC mode.                           |
| <b>Step 5</b> | <b>show running-config</b><br><b>Example:</b><br><br>Device# <code>show running-config</code>                                          | Verifies your entries.                                     |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <code>copy running-config startup-config</code>            | (Optional) Saves your entries in the configuration file.   |

## Configuring a Loopback Interface

### Procedure

|               | Command or Action                            | Purpose                               |
|---------------|----------------------------------------------|---------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b> | Enters the global configuration mode. |

|               | Command or Action                                                                                                       | Purpose                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                                 |                                                                       |
| <b>Step 2</b> | <b>interface loopback 0</b><br><b>Example:</b><br>Device(config)# <code>interface loopback 0</code>                     | Creates a loopback interface, and enter interface configuration mode. |
| <b>Step 3</b> | <b>ip address address mask</b><br><b>Example:</b><br>Device(config-if)# <code>ip address 10.1.1.5 255.255.240.0</code>  | Assign an IP address to this interface.                               |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                       | Returns to privileged EXEC mode.                                      |
| <b>Step 5</b> | <b>show ip interface</b><br><b>Example:</b><br>Device# <code>show ip interface</code>                                   | Verifies your entries.                                                |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file.              |

## Monitoring OSPF

You can display specific statistics such as the contents of IP routing tables, caches, and databases.

*Table 107: Show IP OSPF Statistics Commands*

|                                        |                                                            |
|----------------------------------------|------------------------------------------------------------|
| <code>show ip ospf [process-id]</code> | Displays general information about OSPF routing processes. |
|----------------------------------------|------------------------------------------------------------|

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                |

| <pre>show ip ospf virtual-links</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Displays OSPF-related virtual links information.               |

## Configuration Examples for OSPF

### Example: Configuring Basic OSPF Parameters

This example shows how to configure an OSPF routing process and assign it a process number of 109:

```
Device(config)# router ospf 109
Device(config-router)# network 131.108.0.0 255.255.255.0 area 24
```

## Information About EIGRP

Enhanced IGRP (EIGRP) is a Cisco proprietary enhanced version of the IGRP. EIGRP uses the same distance vector algorithm and distance information as IGRP; however, the convergence properties and the operating efficiency of EIGRP are significantly improved.

The convergence technology employs an algorithm referred to as the Diffusing Update Algorithm (DUAL), which guarantees loop-free operation at every instant throughout a route computation and allows all devices

involved in a topology change to synchronize at the same time. Routers that are not affected by topology changes are not involved in recomputations.

IP EIGRP provides increased network width. With RIP, the largest possible width of your network is 15 hops. Because the EIGRP metric is large enough to support thousands of hops, the only barrier to expanding the network is the transport-layer hop counter. EIGRP increments the transport control field only when an IP packet has traversed 15 routers and the next hop to the destination was learned through EIGRP. When a RIP route is used as the next hop to the destination, the transport control field is incremented as usual.

## EIGRP Features

EIGRP offers these features:

- Fast convergence.
- Incremental updates when the state of a destination changes, instead of sending the entire contents of the routing table, minimizing the bandwidth required for EIGRP packets.
- Less CPU usage because full update packets need not be processed each time they are received.
- Protocol-independent neighbor discovery mechanism to learn about neighboring routers.
- Variable-length subnet masks (VLSMs).
- Arbitrary route summarization.
- EIGRP scales to large networks.

## EIGRP Components

EIGRP has these four basic components:

- Neighbor discovery and recovery is the process that routers use to dynamically learn of other routers on their directly attached networks. Routers must also discover when their neighbors become unreachable or inoperative. Neighbor discovery and recovery is achieved with low overhead by periodically sending small hello packets. As long as hello packets are received, the Cisco IOS software can learn that a neighbor is alive and functioning. When this status is determined, the neighboring routers can exchange routing information.
- The reliable transport protocol is responsible for guaranteed, ordered delivery of EIGRP packets to all neighbors. It supports intermixed transmission of multicast and unicast packets. Some EIGRP packets must be sent reliably, and others need not be. For efficiency, reliability is provided only when necessary. For example, on a multiaccess network that has multicast capabilities (such as Ethernet), it is not necessary to send hellos reliably to all neighbors individually. Therefore, EIGRP sends a single multicast hello with an indication in the packet informing the receivers that the packet need not be acknowledged. Other types of packets (such as updates) require acknowledgment, which is shown in the packet. The reliable transport has a provision to send multicast packets quickly when there are unacknowledged packets pending. Doing so helps ensure that convergence time remains low in the presence of varying speed links.
- The DUAL finite state machine embodies the decision process for all route computations. It tracks all routes advertised by all neighbors. DUAL uses the distance information (known as a metric) to select efficient, loop-free paths. DUAL selects routes to be inserted into a routing table based on feasible successors. A successor is a neighboring router used for packet forwarding that has a least-cost path to

a destination that is guaranteed not to be part of a routing loop. When there are no feasible successors, but there are neighbors advertising the destination, a recomputation must occur. This is the process whereby a new successor is determined. The amount of time it takes to recompute the route affects the convergence time. Recomputation is processor-intensive; it is advantageous to avoid recomputation if it is not necessary. When a topology change occurs, DUAL tests for feasible successors. If there are feasible successors, it uses any it finds to avoid unnecessary recomputation.

- The protocol-dependent modules are responsible for network layer protocol-specific tasks. An example is the IP EIGRP module, which is responsible for sending and receiving EIGRP packets that are encapsulated in IP. It is also responsible for parsing EIGRP packets and informing DUAL of the new information received. EIGRP asks DUAL to make routing decisions, but the results are stored in the IP routing table. EIGRP is also responsible for redistributing routes learned by other IP routing protocols.

---

**Note** To enable EIGRP, the Device or stack master must be running the IP services feature set.

---

## EIGRP Nonstop Forwarding

The Device stack supports two levels of EIGRP nonstop forwarding:

- EIGRP NSF Awareness
- EIGRP NSF Capability

### EIGRP NSF Awareness

The IP-services feature set supports EIGRP NSF Awareness for IPv4. When the neighboring router is NSF-capable, the Layer 3 Device continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router failing and the backup RP taking over, or while the primary RP is manually reloaded for a nondisruptive software upgrade.

This feature cannot be disabled. For more information on this feature, see the “EIGRP Nonstop Forwarding (NSF) Awareness” section of the *Cisco IOS IP Routing Protocols Configuration Guide, Release 12.4*.

### EIGRP NSF Capability

The IP services feature set supports EIGRP Cisco NSF routing to speed up convergence and to eliminate traffic loss after a stack master change. For details about this NSF capability, see the “Configuring Nonstop Forwarding” chapter in the *High Availability Configuration Guide, Cisco IOS XE Release 3S*.

The IP-services feature set also supports EIGRP NSF-capable routing for IPv4 for better convergence and lower traffic loss following a stack master change. When an EIGRP NSF-capable stack master restarts or a new stack master starts up and NSF restarts, the Device has no neighbors, and the topology table is empty. The Device must bring up the interfaces, reacquire neighbors, and rebuild the topology and routing tables without interrupting the traffic directed toward the Device stack. EIGRP peer routers maintain the routes learned from the new stack master and continue forwarding traffic through the NSF restart process.

To prevent an adjacency reset by the neighbors, the new stack master uses a new Restart (RS) bit in the EIGRP packet header to show the restart. When the neighbor receives this, it synchronizes the stack in its peer list

and maintains the adjacency with the stack. The neighbor then sends its topology table to the stack master with the RS bit set to show that it is NSF-aware and is aiding the new stack master.

If at least one of the stack peer neighbors is NSF-aware, the stack master receives updates and rebuilds its database. Each NSF-aware neighbor sends an end of table (EOT) marker in the last update packet to mark the end of the table content. The stack master recognizes the convergence when it receives the EOT marker, and it then begins sending updates. When the stack master has received all EOT markers from its neighbors or when the NSF converge timer expires, EIGRP notifies the routing information database (RIB) of convergence and floods its topology table to all NSF-aware peers.

## EIGRP Stub Routing

The EIGRP stub routing feature, available in all feature sets, reduces resource utilization by moving routed traffic closer to the end user.

---

**Note**

The IP Base feature set contains EIGRP stub routing capability, which only advertises connected or summary routes from the routing tables to other Devices in the network. The Device uses EIGRP stub routing at the access layer to eliminate the need for other types of routing advertisements. For enhanced capability and complete EIGRP routing, the Device must be running the IP Base feature set. On a Device running the IP base feature set, if you try to configure multi-VRF-CE and EIGRP stub routing at the same time, the configuration is not allowed. IPv6 EIGRP stub routing is not supported with the IP base feature set.

---

In a network using EIGRP stub routing, the only allowable route for IP traffic to the user is through a Device that is configured with EIGRP stub routing. The Device sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

When using EIGRP stub routing, you need to configure the distribution and remote routers to use EIGRP and to configure only the Device as a stub. Only specified routes are propagated from the Device. The Device responds to all queries for summaries, connected routes, and routing updates.

Any neighbor that receives a packet informing it of the stub status does not query the stub router for any routes, and a router that has a stub peer does not query that peer. The stub router depends on the distribution router to send the proper updates to all peers.

In the figure given below, Device B is configured as an EIGRP stub router. Devices A and C are connected to the rest of the WAN. Device B advertises connected, static, redistribution, and summary routes to Device A and C. Device B does not advertise any routes learned from Device A (and the reverse).

Figure 85: EIGRP Stub Router Configuration

For more information about EIGRP stub routing, see “Configuring EIGRP Stub Routing” section of the *Cisco IOS IP Configuration Guide, Volume 2 of 3: Routing Protocols*.

## How to Configure EIGRP

To create an EIGRP routing process, you must enable EIGRP and associate networks. EIGRP sends updates to the interfaces in the specified networks. If you do not specify an interface network, it is not advertised in any EIGRP update.

**Note** If you have routers on your network that are configured for IGRP, and you want to change to EIGRP, you must designate transition routers that have both IGRP and EIGRP configured. In these cases, perform Steps 1 through 3 in the next section and also see the “Configuring Split Horizon” section. You must use the same AS number for routes to be automatically redistributed.

## Default EIGRP Configuration

Table 108: Default EIGRP Configuration

| Feature             | Default Setting                                                                                                   |
|---------------------|-------------------------------------------------------------------------------------------------------------------|
| Auto summary        | Disabled.                                                                                                         |
| Default-information | Exterior routes are accepted and default information is passed between EIGRP processes when doing redistribution. |

| Feature                            | Default Setting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Default metric                     | <p>Only connected routes and interface static routes can be redistributed without a default metric. The metric includes:</p> <ul style="list-style-type: none"> <li>• Bandwidth: 0 or greater kb/s.</li> <li>• Delay (tens of microseconds): 0 or any positive number that is a multiple of 39.1 nanoseconds.</li> <li>• Reliability: any number between 0 and 255 (255 means 100 percent reliability).</li> <li>• Loading: effective bandwidth as a number between 0 and 255 (255 is 100 percent loading).</li> <li>• MTU: maximum transmission unit size of the route in bytes. 0 or any positive integer.</li> </ul> |
| Distance                           | <p>Internal distance: 90.<br/>External distance: 170.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| EIGRP log-neighbor changes         | Disabled. No adjacency changes logged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| IP authentication key-chain        | No authentication provided.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IP authentication mode             | No authentication provided.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IP bandwidth-percent               | 50 percent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IP hello interval                  | For low-speed nonbroadcast multiaccess (NBMA) networks: 60 seconds; all other networks: 5 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| IP hold-time                       | For low-speed NBMA networks: 180 seconds; all other networks: 15 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| IP split-horizon                   | Enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| IP summary address                 | No summary aggregate addresses are predefined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Network                            | None specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Nonstop Forwarding (NSF) Awareness | Enabled for IPv4 on switches running the IP services feature set. Allows Layer 3 switches to continue forwarding packets from a neighboring NSF-capable router during hardware or software changes.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| NSF capability                     | <p>Disabled.</p> <p><b>Note</b> The Device supports EIGRP NSF-capable routing for IPv4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Feature       | Default Setting                                           |
|---------------|-----------------------------------------------------------|
| Offset-list   | Disabled.                                                 |
| Router EIGRP  | Disabled.                                                 |
| Set metric    | No metric set in the route map.                           |
| Traffic-share | Distributed proportionately to the ratios of the metrics. |
| Variance      | 1 (equal-cost load-balancing).                            |

## Configuring Basic EIGRP Parameters

### Procedure

|               | Command or Action                                                                                                      | Purpose                                                                                                                                                                   |
|---------------|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                | Enters the global configuration mode.                                                                                                                                     |
| <b>Step 2</b> | <b>router eigrp</b> autonomous-system<br><b>Example:</b><br>Device(config)# <code>router eigrp 10</code>               | Enables an EIGRP routing process, and enter router configuration mode. The AS number identifies the routes to other EIGRP routers and is used to tag routing information. |
| <b>Step 3</b> | <b>nsf</b><br><b>Example:</b><br>Device(config)# <code>nsf</code>                                                      | (Optional) Enables EIGRP NSF. Enter this command on the stack master and on all of its peers.                                                                             |
| <b>Step 4</b> | <b>network</b> network-number<br><b>Example:</b><br>Device(config)# <code>network 192.168.0.0</code>                   | Associate networks with an EIGRP routing process. EIGRP sends updates to the interfaces in the specified networks.                                                        |
| <b>Step 5</b> | <b>eigrp log-neighbor-changes</b><br><b>Example:</b><br>Device(config)# <code>eigrp log-neighbor-changes</code>        | (Optional) Enables logging of EIGRP neighbor changes to monitor routing system stability.                                                                                 |
| <b>Step 6</b> | <b>metric weights</b> tos k1 k2 k3 k4 k5<br><b>Example:</b><br>Device(config)# <code>metric weights 0 2 0 2 0 0</code> | (Optional) Adjust the EIGRP metric. Although the defaults have been carefully set to provide excellent operation in most networks, you can adjust them.                   |

|                | Command or Action                                                                                                                                                                          | Purpose                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                                                                                            | <b>Caution</b> Setting metrics is complex and is not recommended without guidance from an experienced network designer.                                                                            |
| <b>Step 7</b>  | <b>offset-list</b> [ <i>access-list number   name</i> ] { <b>in</b>   <b>out</b> } <i>offset</i> [ <i>type number</i> ]<br><b>Example:</b><br>Device(config)# <b>offset-list 21 out 10</b> | (Optional) Applies an offset list to routing metrics to increase incoming and outgoing metrics to routes learned through EIGRP. You can limit the offset list with an access list or an interface. |
| <b>Step 8</b>  | <b>auto-summary</b><br><b>Example:</b><br>Device(config)# <b>auto-summary</b>                                                                                                              | (Optional) Enables automatic summarization of subnet routes into network-level routes.                                                                                                             |
| <b>Step 9</b>  | <b>ip summary-address eigrp</b> <i>autonomous-system-number</i> <i>address mask</i><br><b>Example:</b><br>Device(config)# <b>ip summary-address eigrp 1 192.168.0.0 255.255.0.0</b>        | (Optional) Configures a summary aggregate.                                                                                                                                                         |
| <b>Step 10</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                                                | Returns to privileged EXEC mode.                                                                                                                                                                   |
| <b>Step 11</b> | <b>show ip protocols</b><br><b>Example:</b><br>Device# <b>show ip protocols</b>                                                                                                            | Verifies your entries.<br>For NSF awareness, the output shows:<br>*** IP Routing is NSF aware *** EIGRP NSF enabled                                                                                |
| <b>Step 12</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                                                                          | (Optional) Saves your entries in the configuration file.                                                                                                                                           |

## Configuring EIGRP Interfaces

Other optional EIGRP parameters can be configured on an interface basis.

## Procedure

|               | Command or Action                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                             |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                 | Enters the global configuration mode.                                                                                                                                                                                                                                                               |
| <b>Step 2</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet 1/0/1</code>                                                                 | Enters interface configuration mode, and specifies the Layer 3 interface to configure.                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>ip bandwidth-percent eigrp <i>percent</i></b><br><b>Example:</b><br>Device(config-if)# <code>ip bandwidth-percent eigrp 60</code>                                                    | (Optional) Configures the percentage of bandwidth that can be used by EIGRP on an interface. The default is 50 percent.                                                                                                                                                                             |
| <b>Step 4</b> | <b>ip summary-address eigrp <i>autonomous-system-number address mask</i></b><br><b>Example:</b><br>Device(config-if)# <code>ip summary-address eigrp 109 192.161.0.0 255.255.0.0</code> | (Optional) Configures a summary aggregate address for a specified interface (not usually necessary if auto-summary is enabled).                                                                                                                                                                     |
| <b>Step 5</b> | <b>ip hello-interval eigrp <i>autonomous-system-number seconds</i></b><br><b>Example:</b><br>Device(config-if)# <code>ip hello-interval eigrp 109 10</code>                             | (Optional) Change the hello time interval for an EIGRP routing process. The range is 1 to 65535 seconds. The default is 60 seconds for low-speed NBMA networks and 5 seconds for all other networks.                                                                                                |
| <b>Step 6</b> | <b>ip hold-time eigrp <i>autonomous-system-number seconds</i></b><br><b>Example:</b><br>Device(config-if)# <code>ip hold-time eigrp 109 40</code>                                       | (Optional) Change the hold time interval for an EIGRP routing process. The range is 1 to 65535 seconds. The default is 180 seconds for low-speed NBMA networks and 15 seconds for all other networks.<br><br><b>Caution</b> Do not adjust the hold time without consulting Cisco technical support. |
| <b>Step 7</b> | <b>no ip split-horizon eigrp <i>autonomous-system-number</i></b><br><b>Example:</b><br>Device(config-if)# <code>no ip split-horizon eigrp 109</code>                                    | (Optional) Disables split horizon to allow route information to be advertised by a router out any interface from which that information originated.                                                                                                                                                 |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b>                                                                                                                                                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                    |

|                | Command or Action                                                                                          | Purpose                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
|                | Device(config)# <b>end</b>                                                                                 |                                                                                                        |
| <b>Step 9</b>  | <b>show ip eigrp interface</b><br><b>Example:</b><br>Device# show ip eigrp interface                       | Displays which interfaces EIGRP is active on and information about EIGRP relating to those interfaces. |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file.                                               |

## Configuring EIGRP Route Authentication

EIGRP route authentication provides MD5 authentication of routing updates from the EIGRP routing protocol to prevent the introduction of unauthorized or false routing messages from unapproved sources.

### Procedure

|               | Command or Action                                                                                                                                                        | Purpose                                                                                |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                               | Enters the global configuration mode.                                                  |
| <b>Step 2</b> | <b>interface interface-id</b><br><b>Example:</b><br>Device(config)# interface gigabitethernet 1/0/1                                                                      | Enters interface configuration mode, and specifies the Layer 3 interface to configure. |
| <b>Step 3</b> | <b>ip authentication mode eigrp <i>autonomous-system</i> md5</b><br><b>Example:</b><br>Device(config-if)# ip authentication mode eigrp 104 md5                           | Enables MD5 authentication in IP EIGRP packets.                                        |
| <b>Step 4</b> | <b>ip authentication key-chain eigrp <i>autonomous-system</i> <i>key-chain</i></b><br><b>Example:</b><br>Device(config-if)# ip authentication key-chain eigrp 105 chain1 | Enables authentication of IP EIGRP packets.                                            |

|         | Command or Action                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5  | <b>exit</b><br><b>Example:</b><br>Device(config-if)# exit                                                                                                                                                | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                                     |
| Step 6  | <b>key chain <i>name-of-chain</i></b><br><b>Example:</b><br>Device(config)# key chain chain1                                                                                                             | Identify a key chain and enter key-chain configuration mode. Match the name configured in Step 4.                                                                                                                                                                                                                                                                                                         |
| Step 7  | <b>key <i>number</i></b><br><b>Example:</b><br>Device(config-keychain)# key 1                                                                                                                            | In key-chain configuration mode, identify the key number.                                                                                                                                                                                                                                                                                                                                                 |
| Step 8  | <b>key-string <i>text</i></b><br><b>Example:</b><br>Device(config-keychain-key)# key-string key1                                                                                                         | In key-chain key configuration mode, identify the key string.                                                                                                                                                                                                                                                                                                                                             |
| Step 9  | <b>accept-lifetime <i>start-time</i> {infinite   <i>end-time</i>   duration <i>seconds</i>}</b><br><b>Example:</b><br>Device(config-keychain-key)# accept-lifetime<br>13:30:00 Jan 25 2011 duration 7200 | (Optional) Specifies the time period during which the key can be received.<br><br>The <i>start-time</i> and <i>end-time</i> syntax can be either <i>hh:mm:ss Month date year</i> or <i>hh:mm:ss date Month year</i> . The default is forever with the default <i>start-time</i> and the earliest acceptable date as January 1, 1993. The default <i>end-time</i> and <b>duration</b> is <b>infinite</b> . |
| Step 10 | <b>send-lifetime <i>start-time</i> {infinite   <i>end-time</i>   duration <i>seconds</i>}</b><br><b>Example:</b><br>Device(config-keychain-key)# send-lifetime<br>14:00:00 Jan 25 2011 duration 3600     | (Optional) Specifies the time period during which the key can be sent.<br><br>The <i>start-time</i> and <i>end-time</i> syntax can be either <i>hh:mm:ss Month date year</i> or <i>hh:mm:ss date Month year</i> . The default is forever with the default <i>start-time</i> and the earliest acceptable date as January 1, 1993. The default <i>end-time</i> and <b>duration</b> is <b>infinite</b> .     |
| Step 11 | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                                                                                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                          |
| Step 12 | <b>show key chain</b><br><b>Example:</b><br>Device# show key chain                                                                                                                                       | Displays authentication key information.                                                                                                                                                                                                                                                                                                                                                                  |

|         | Command or Action                                                                                                       | Purpose                                                  |
|---------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 13 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Monitoring and Maintaining EIGRP

You can delete neighbors from the neighbor table. You can also display various EIGRP routing statistics. The table given below lists the privileged EXEC commands for deleting neighbors and displaying statistics. For explanations of fields in the resulting display, see the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4*.

**Table 109: IP EIGRP Clear and Show Commands**

|                                                                                                              |                                                                                        |
|--------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>clear ip eigrp neighbors</b> [ <i>if-address</i>   <i>interface</i> ]                                     | Deletes neighbors from the neighbor table.                                             |
| <b>show ip eigrp interface</b> [ <i>interface</i> ] [ <i>as number</i> ]                                     | Displays information about interfaces configured for EIGRP.                            |
| <b>show ip eigrp neighbors</b> [ <i>type-number</i> ]                                                        | Displays EIGRP discovered neighbors.                                                   |
| <b>show ip eigrp topology</b><br>[ <i>autonomous-system-number</i> ]   [[ <i>ip-address</i> ] <i>mask</i> ]] | Displays the EIGRP topology table for a given process.                                 |
| <b>show ip eigrp traffic</b> [ <i>autonomous-system-number</i> ]                                             | Displays the number of packets sent and received for all or a specified EIGRP process. |

## Information About BGP

The Border Gateway Protocol (BGP) is an exterior gateway protocol used to set up an interdomain routing system that guarantees the loop-free exchange of routing information between autonomous systems. Autonomous systems are made up of routers that operate under the same administration and that run Interior Gateway Protocols (IGPs), such as RIP or OSPF, within their boundaries and that interconnect by using an Exterior Gateway Protocol (EGP). BGP Version 4 is the standard EGP for interdomain routing in the Internet. The protocol is defined in RFCs 1163, 1267, and 1771. You can find detailed information about BGP in *Internet Routing Architectures*, published by Cisco Press, and in the “Configuring BGP” chapter in the *Cisco IP and IP Routing Configuration Guide*.

For details about BGP commands and keywords, see the “IP Routing Protocols” part of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols*.

## BGP Network Topology

Routers that belong to the same autonomous system (AS) and that exchange BGP updates run internal BGP (IBGP), and routers that belong to different autonomous systems and that exchange BGP updates run external

BGP (EBGP). Most configuration commands are the same for configuring EBGP and IBGP. The difference is that the routing updates are exchanged either between autonomous systems (EBGP) or within an AS (IBGP). The figure given below shows a network that is running both EBGP and IBGP.

**Figure 86: EBGP, IBGP, and Multiple Autonomous Systems**

Before exchanging information with an external AS, BGP ensures that networks within the AS can be reached by defining internal BGP peering among routers within the AS and by redistributing BGP routing information to IGP that run within the AS, such as IGRP and OSPF.

Routers that run a BGP routing process are often referred to as BGP speakers. BGP uses the Transmission Control Protocol (TCP) as its transport protocol (specifically port 179). Two BGP speakers that have a TCP connection to each other for exchanging routing information are known as peers or neighbors. In the above figure, Routers A and B are BGP peers, as are Routers B and C and Routers C and D. The routing information is a series of AS numbers that describe the full path to the destination network. BGP uses this information to construct a loop-free map of autonomous systems.

The network has these characteristics:

- Routers A and B are running EBGP, and Routers B and C are running IBGP. Note that the EBGP peers are directly connected and that the IBGP peers are not. As long as there is an IGP running that allows the two neighbors to reach one another, IBGP peers do not have to be directly connected.
- All BGP speakers within an AS must establish a peer relationship with each other. That is, the BGP speakers within an AS must be fully meshed logically. BGP4 provides two techniques that reduce the requirement for a logical full mesh: confederations and route reflectors.
- AS 200 is a transit AS for AS 100 and AS 300—that is, AS 200 is used to transfer packets between AS 100 and AS 300.

BGP peers initially exchange their full BGP routing tables and then send only incremental updates. BGP peers also exchange keepalive messages (to ensure that the connection is up) and notification messages (in response to errors or special conditions).

In BGP, each route consists of a network number, a list of autonomous systems that information has passed through (the autonomous system path), and a list of other path attributes. The primary function of a BGP system is to exchange network reachability information, including information about the list of AS paths, with other BGP systems. This information can be used to determine AS connectivity, to prune routing loops, and to enforce AS-level policy decisions.

A router or Device running Cisco IOS does not select or use an IBGP route unless it has a route available to the next-hop router and it has received synchronization from an IGP (unless IGP synchronization is disabled). When multiple routes are available, BGP bases its path selection on attribute values. See the “Configuring BGP Decision Attributes” section for information about BGP attributes.

BGP Version 4 supports classless interdomain routing (CIDR) so you can reduce the size of your routing tables by creating aggregate routes, resulting in supernets. CIDR eliminates the concept of network classes within BGP and supports the advertising of IP prefixes.

## Nonstop Forwarding Awareness

The BGP NSF Awareness feature is supported for IPv4 in the IP services feature set. To enable this feature with BGP routing, you need to enable Graceful Restart. When the neighboring router is NSF-capable, and this feature is enabled, the Layer 3 Device continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router failing and the backup RP taking over, or while the primary RP is manually reloaded for a nondisruptive software upgrade.

For more information, see the “BGP Nonstop Forwarding (NSF) Awareness” section of the *Cisco IOS IP Routing Protocols Configuration Guide, Release 12.4*.

## Information About BGP Routing

To enable BGP routing, you establish a BGP routing process and define the local network. Because BGP must completely recognize the relationships with its neighbors, you must also specify a BGP neighbor.

BGP supports two kinds of neighbors: internal and external. Internal neighbors are in the same AS; external neighbors are in different autonomous systems. External neighbors are usually adjacent to each other and share a subnet, but internal neighbors can be anywhere in the same AS.

The switch supports the use of private AS numbers, usually assigned by service providers and given to systems whose routes are not advertised to external neighbors. The private AS numbers are from 64512 to 65535. You can configure external neighbors to remove private AS numbers from the AS path by using the **neighbor remove-private-as** router configuration command. Then when an update is passed to an external neighbor, if the AS path includes private AS numbers, these numbers are dropped.

If your AS will be passing traffic through it from another AS to a third AS, it is important to be consistent about the routes it advertises. If BGP advertised a route before all routers in the network had learned about the route through the IGP, the AS might receive traffic that some routers could not yet route. To prevent this from happening, BGP must wait until the IGP has propagated information across the AS so that BGP is synchronized with the IGP. Synchronization is enabled by default. If your AS does not pass traffic from one AS to another AS, or if all routers in your autonomous systems are running BGP, you can disable synchronization, which allows your network to carry fewer routes in the IGP and allows BGP to converge more quickly.

## Routing Policy Changes

Routing policies for a peer include all the configurations that might affect inbound or outbound routing table updates. When you have defined two routers as BGP neighbors, they form a BGP connection and exchange routing information. If you later change a BGP filter, weight, distance, version, or timer, or make a similar configuration change, you must reset the BGP sessions so that the configuration changes take effect.

There are two types of reset, hard reset and soft reset. Cisco IOS Releases 12.1 and later support a soft reset without any prior configuration. To use a soft reset without preconfiguration, both BGP peers must support the soft route refresh capability, which is advertised in the OPEN message sent when the peers establish a TCP session. A soft reset allows the dynamic exchange of route refresh requests and routing information between BGP routers and the subsequent re-advertisement of the respective outbound routing table.

- When soft reset generates inbound updates from a neighbor, it is called dynamic inbound soft reset.
- When soft reset sends a set of updates to a neighbor, it is called outbound soft reset.

A soft inbound reset causes the new inbound policy to take effect. A soft outbound reset causes the new local outbound policy to take effect without resetting the BGP session. As a new set of updates is sent during outbound policy reset, a new inbound policy can also take effect.

The table given below lists the advantages and disadvantages hard reset and soft reset.

**Table 110: Advantages and Disadvantages of Hard and Soft Resets**

| Type of Reset              | Advantages                                                                                                                   | Disadvantages                                                                                     |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| Hard reset                 | No memory overhead                                                                                                           | The prefixes in the BGP, IP, and FIB tables provided by the neighbor are lost. Not recommended.   |
| Outbound soft reset        | No configuration, no storing of routing table updates                                                                        | Does not reset inbound routing table updates.                                                     |
| Dynamic inbound soft reset | Does not clear the BGP session and cache<br><br>Does not require storing of routing table updates and has no memory overhead | Both BGP routers must support the route refresh capability (in Cisco IOS Release 12.1 and later). |

## BGP Decision Attributes

When a BGP speaker receives updates from multiple autonomous systems that describe different paths to the same destination, it must choose the single best path for reaching that destination. When chosen, the selected path is entered into the BGP routing table and propagated to its neighbors. The decision is based on the value of attributes that the update contains and other BGP-configurable factors.

When a BGP peer learns two EBGp paths for a prefix from a neighboring AS, it chooses the best path and inserts that path in the IP routing table. If BGP multipath support is enabled and the EBGp paths are learned from the same neighboring autonomous systems, instead of a single best path, multiple paths are installed in the IP routing table. Then, during packet switching, per-packet or per-destination load-balancing is performed among the multiple paths. The **maximum-paths** router configuration command controls the number of paths allowed.

These factors summarize the order in which BGP evaluates the attributes for choosing the best path:

1. If the path specifies a next hop that is inaccessible, drop the update. The BGP next-hop attribute, automatically determined by the software, is the IP address of the next hop that is going to be used to reach a destination. For EBGp, this is usually the IP address of the neighbor specified by the **neighbor**

**remote-as router** configuration command. You can disable next-hop processing by using route maps or the **neighbor next-hop-self** router configuration command.

2. Prefer the path with the largest weight (a Cisco proprietary parameter). The weight attribute is local to the router and not propagated in routing updates. By default, the weight attribute is 32768 for paths that the router originates and zero for other paths. Routes with the largest weight are preferred. You can use access lists, route maps, or the **neighbor weight** router configuration command to set weights.
3. Prefer the route with the highest local preference. Local preference is part of the routing update and exchanged among routers in the same AS. The default value of the local preference attribute is 100. You can set local preference by using the **bgp default local-preference** router configuration command or by using a route map.
4. Prefer the route that was originated by BGP running on the local router.
5. Prefer the route with the shortest AS path.
6. Prefer the route with the lowest origin type. An interior route or IGP is lower than a route learned by EGP, and an EGP-learned route is lower than one of unknown origin or learned in another way.
7. Prefer the route with the lowest multi-exit discriminator (MED) metric attribute if the neighboring AS is the same for all routes considered. You can configure the MED by using route maps or by using the **default-metric** router configuration command. When an update is sent to an IBGP peer, the MED is included.
8. Prefer the external (EBGP) path over the internal (IBGP) path.
9. Prefer the route that can be reached through the closest IGP neighbor (the lowest IGP metric). This means that the router will prefer the shortest internal path within the AS to reach the destination (the shortest path to the BGP next-hop).
10. If the following conditions are all true, insert the route for this path into the IP routing table:
  - Both the best route and this route are external.
  - Both the best route and this route are from the same neighboring autonomous system.
  - Maximum-paths is enabled.
11. If multipath is not enabled, prefer the route with the lowest IP address value for the BGP router ID. The router ID is usually the highest IP address on the router or the loopback (virtual) address, but might be implementation-specific.

## Route Maps

Within BGP, route maps can be used to control and to modify routing information and to define the conditions by which routes are redistributed between routing domains. See the “Using Route Maps to Redistribute Routing Information” section for more information about route maps. Each route map has a name that identifies the route map (*map tag*) and an optional sequence number.

## BGP Filtering

You can filter BGP advertisements by using AS-path filters, such as the **as-path access-list** global configuration command and the **neighbor filter-list** router configuration command. You can also use access lists with the **neighbor distribute-list** router configuration command. Distribute-list filters are applied to network numbers.

See the “Controlling Advertising and Processing in Routing Updates” section for information about the **distribute-list** command.

You can use route maps on a per-neighbor basis to filter updates and to modify various attributes. A route map can be applied to either inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates. On both inbound and outbound updates, matching is supported based on AS path, community, and network numbers. Autonomous system path matching requires the **match as-path access-list** route-map command, community based matching requires the **match community-list** route-map command, and network-based matching requires the **ip access-list** global configuration command.

## Prefix List for BGP Filtering

You can use prefix lists as an alternative to access lists in many BGP route filtering commands, including the **neighbor distribute-list** router configuration command. The advantages of using prefix lists include performance improvements in loading and lookup of large lists, incremental update support, easier CLI configuration, and greater flexibility.

Filtering by a prefix list involves matching the prefixes of routes with those listed in the prefix list, as when matching access lists. When there is a match, the route is used. Whether a prefix is permitted or denied is based upon these rules:

- An empty prefix list permits all prefixes.
- An implicit deny is assumed if a given prefix does not match any entries in a prefix list.
- When multiple entries of a prefix list match a given prefix, the sequence number of a prefix list entry identifies the entry with the lowest sequence number.

By default, sequence numbers are generated automatically and incremented in units of five. If you disable the automatic generation of sequence numbers, you must specify the sequence number for each entry. You can specify sequence values in any increment. If you specify increments of one, you cannot insert additional entries into the list; if you choose very large increments, you might run out of values.

## BGP Community Filtering

One way that BGP controls the distribution of routing information based on the value of the COMMUNITIES attribute. The attribute is a way to groups destinations into communities and to apply routing decisions based on the communities. This method simplifies configuration of a BGP speaker to control distribution of routing information.

A community is a group of destinations that share some common attribute. Each destination can belong to multiple communities. AS administrators can define to which communities a destination belongs. By default, all destinations belong to the general Internet community. The community is identified by the COMMUNITIES attribute, an optional, transitive, global attribute in the numerical range from 1 to 4294967200. These are some predefined, well-known communities:

- **internet**—Advertise this route to the Internet community. All routers belong to it.
- **no-export**—Do not advertise this route to EBGp peers.
- **no-advertise**—Do not advertise this route to any peer (internal or external).
- **local-as**—Do not advertise this route to peers outside the local autonomous system.

Based on the community, you can control which routing information to accept, prefer, or distribute to other neighbors. A BGP speaker can set, append, or modify the community of a route when learning, advertising, or redistributing routes. When routes are aggregated, the resulting aggregate has a COMMUNITIES attribute that contains all communities from all the initial routes.

You can use community lists to create groups of communities to use in a match clause of a route map. As with an access list, a series of community lists can be created. Statements are checked until a match is found. As soon as one statement is satisfied, the test is concluded.

To set the COMMUNITIES attribute and match clauses based on communities, see the **match community-list** and **set community** route-map configuration commands in the “Using Route Maps to Redistribute Routing Information” section.

## BGP Neighbors and Peer Groups

Often many BGP neighbors are configured with the same update policies (that is, the same outbound route maps, distribute lists, filter lists, update source, and so on). Neighbors with the same update policies can be grouped into peer groups to simplify configuration and to make updating more efficient. When you have configured many peers, we recommend this approach.

To configure a BGP peer group, you create the peer group, assign options to the peer group, and add neighbors as peer group members. You configure the peer group by using the **neighbor** router configuration commands. By default, peer group members inherit all the configuration options of the peer group, including the remote-as (if configured), version, update-source, out-route-map, out-filter-list, out-dist-list, minimum-advertisement-interval, and next-hop-self. All peer group members also inherit changes made to the peer group. Members can also be configured to override the options that do not affect outbound updates.

## Aggregate Routes

Classless interdomain routing (CIDR) enables you to create aggregate routes (or supernets) to minimize the size of routing tables. You can configure aggregate routes in BGP either by redistributing an aggregate route into BGP or by creating an aggregate entry in the BGP routing table. An aggregate address is added to the BGP table when there is at least one more specific entry in the BGP table.

## Routing Domain Confederations

One way to reduce the IBGP mesh is to divide an autonomous system into multiple subautonomous systems and to group them into a single confederation that appears as a single autonomous system. Each autonomous system is fully meshed within itself and has a few connections to other autonomous systems in the same confederation. Even though the peers in different autonomous systems have EBGP sessions, they exchange routing information as if they were IBGP peers. Specifically, the next hop, MED, and local preference information is preserved. You can then use a single IGP for all of the autonomous systems.

## BGP Route Reflectors

BGP requires that all of the IBGP speakers be fully meshed. When a router receives a route from an external neighbor, it must advertise it to all internal neighbors. To prevent a routing information loop, all IBGP speakers must be connected. The internal neighbors do not send routes learned from internal neighbors to other internal neighbors.

With route reflectors, all IBGP speakers need not be fully meshed because another method is used to pass learned routes to neighbors. When you configure an internal BGP peer to be a route reflector, it is responsible for passing IBGP learned routes to a set of IBGP neighbors. The internal peers of the route reflector are divided into two groups: client peers and nonclient peers (all the other routers in the autonomous system). A route reflector reflects routes between these two groups. The route reflector and its client peers form a cluster. The nonclient peers must be fully meshed with each other, but the client peers need not be fully meshed. The clients in the cluster do not communicate with IBGP speakers outside their cluster.

When the route reflector receives an advertised route, it takes one of these actions, depending on the neighbor:

- A route from an external BGP speaker is advertised to all clients and nonclient peers.
- A route from a nonclient peer is advertised to all clients.
- A route from a client is advertised to all clients and nonclient peers. Hence, the clients need not be fully meshed.

Usually a cluster of clients have a single route reflector, and the cluster is identified by the route reflector router ID. To increase redundancy and to avoid a single point of failure, a cluster might have more than one route reflector. In this case, all route reflectors in the cluster must be configured with the same 4-byte cluster ID so that a route reflector can recognize updates from route reflectors in the same cluster. All the route reflectors serving a cluster should be fully meshed and should have identical sets of client and nonclient peers.

## Route Dampening

Route flap dampening is a BGP feature designed to minimize the propagation of flapping routes across an internetwork. A route is considered to be flapping when it is repeatedly available, then unavailable, then available, then unavailable, and so on. When route dampening is enabled, a numeric penalty value is assigned to a route when it flaps. When a route's accumulated penalties reach a configurable limit, BGP suppresses advertisements of the route, even if the route is running. The reuse limit is a configurable value that is compared with the penalty. If the penalty is less than the reuse limit, a suppressed route that is up is advertised again.

Dampening is not applied to routes that are learned by IBGP. This policy prevents the IBGP peers from having a higher penalty for routes external to the AS.

# How to Configure BGP

## Default BGP Configuration

The table given below shows the basic default BGP configuration. For the defaults for all characteristics, see the specific commands in the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4*.

**Table 111: Default BGP Configuration**

| Feature             | Default Setting         |
|---------------------|-------------------------|
| Aggregate address   | Disabled: None defined. |
| AS path access list | None defined.           |

| Feature                                                            | Default Setting                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Timers                        | Keepalive: 60 seconds; holdtime: 180 seconds. |

<sup>6</sup> Nonstop Forwarding

<sup>7</sup> NSF Awareness can be enabled for IPv4 on switches with the IP services feature set by enabling Graceful Restart.

## Enabling BGP Routing

### Before you begin

**Note** To enable BGP, the switch or stack master must be running the IP services feature set.

### Procedure

|               | Command or Action                                                                                                                                                                      | Purpose                                                                                                                                                                                         |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                | Enters the global configuration mode.                                                                                                                                                           |
| <b>Step 2</b> | <b>ip routing</b><br><b>Example:</b><br>Device(config)# <code>ip routing</code>                                                                                                        | Enables IP routing.                                                                                                                                                                             |
| <b>Step 3</b> | <b>router bgp <i>autonomous-system</i></b><br><b>Example:</b><br>Device(config)# <code>router bgp 45000</code>                                                                         | Enables a BGP routing process, assign it an AS number, and enter router configuration mode. The AS number can be from 1 to 65535, with 64512 to 65535 designated as private autonomous numbers. |
| <b>Step 4</b> | <b>network <i>network-number</i> [<i>mask network-mask</i>]<br/>           [<i>route-map route-map-name</i>]</b><br><b>Example:</b><br>Device(config)# <code>network 10.108.0.0</code> | Configures a network as local to this AS, and enter it in the BGP table.                                                                                                                        |

|                | Command or Action                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b>  | <p><b>neighbor</b> {ip-address   peer-group-name} <b>remote-as</b> number</p> <p><b>Example:</b></p> <pre>Device(config)# neighbor 10.108.1.2 remote-as 65200</pre>     | <p>Adds an entry to the BGP neighbor table specifying that the neighbor identified by the IP address belongs to the specified AS.</p> <p>For EBGP, neighbors are usually directly connected, and the IP address is the address of the interface at the other end of the connection.</p> <p>For IBGP, the IP address can be the address of any of the router interfaces.</p> |
| <b>Step 6</b>  | <p><b>neighbor</b> {ip-address   peer-group-name} <b>remove-private-as</b></p> <p><b>Example:</b></p> <pre>Device(config)# neighbor 172.16.2.33 remove-private-as</pre> | (Optional) Removes private AS numbers from the AS-path in outbound routing updates.                                                                                                                                                                                                                                                                                         |
| <b>Step 7</b>  | <p><b>synchronization</b></p> <p><b>Example:</b></p> <pre>Device(config)# synchronization</pre>                                                                         | (Optional) Enables synchronization between BGP and an IGP.                                                                                                                                                                                                                                                                                                                  |
| <b>Step 8</b>  | <p><b>auto-summary</b></p> <p><b>Example:</b></p> <pre>Device(config)# auto-summary</pre>                                                                               | (Optional) Enables automatic network summarization. When a subnet is redistributed from an IGP into BGP, only the network route is inserted into the BGP table.                                                                                                                                                                                                             |
| <b>Step 9</b>  | <p><b>bgp graceful-restart</b></p> <p><b>Example:</b></p> <pre>Device(config)# bgp graceful-start</pre>                                                                 | (Optional) Enables NSF awareness on switch. By default, NSF awareness is disabled.                                                                                                                                                                                                                                                                                          |
| <b>Step 10</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                 | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 11</b> | <p><b>show ip bgp network</b> network-number</p> <p><b>Example:</b></p> <pre>Device# show ip bgp network 10.108.0.0</pre>                                               | Verifies the configuration.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 12</b> | <p><b>show ip bgp neighbor</b></p> <p><b>Example:</b></p> <pre>Device# show ip bgp neighbor</pre>                                                                       | <p>Verifies that NSF awareness (Graceful Restart) is enabled on the neighbor.</p> <p>If NSF awareness is enabled on the switch and the neighbor, this message appears:</p> <p><i>Graceful Restart Capability: advertised and received</i></p>                                                                                                                               |

|                | Command or Action                                                                                                               | Purpose                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                                 | If NSF awareness is enabled on the switch, but not on the neighbor, this message appears:<br><i>Graceful Restart Capability: advertised</i> |
| <b>Step 13</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file.                                                                                    |

## Managing Routing Policy Changes

To learn if a BGP peer supports the route refresh capability and to reset the BGP session:

### Procedure

|               | Command or Action                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>show ip bgp neighbors</b><br><br><b>Example:</b><br><br>Device# <code>show ip bgp neighbors</code>                                                         | Displays whether a neighbor supports the route refresh capability. When supported, this message appears for the router:<br><br><i>Received route refresh capability from peer.</i>                                                                                                                                                                                                                               |
| <b>Step 2</b> | <b>clear ip bgp</b> {*   <i>address</i>   <i>peer-group-name</i> }<br><br><b>Example:</b><br><br>Device# <code>clear ip bgp *</code>                          | Resets the routing table on the specified connection. <ul style="list-style-type: none"> <li>• Enter an asterisk (*) to specify that all connections be reset.</li> <li>• Enter an IP address to specify the connection to be reset.</li> <li>• Enter a peer group name to reset the peer group.</li> </ul>                                                                                                      |
| <b>Step 3</b> | <b>clear ip bgp</b> {*   <i>address</i>   <i>peer-group-name</i> } <b>soft out</b><br><br><b>Example:</b><br><br>Device# <code>clear ip bgp * soft out</code> | (Optional) Performs an outbound soft reset to reset the inbound routing table on the specified connection. Use this command if route refresh is supported. <ul style="list-style-type: none"> <li>• Enter an asterisk (*) to specify that all connections be reset.</li> <li>• Enter an IP address to specify the connection to be reset.</li> <li>• Enter a peer group name to reset the peer group.</li> </ul> |
| <b>Step 4</b> | <b>show ip bgp</b><br><br><b>Example:</b><br><br>Device# <code>show ip bgp</code>                                                                             | Verifies the reset by checking information about the routing table and about BGP neighbors.                                                                                                                                                                                                                                                                                                                      |

|               | Command or Action                                                                | Purpose                                                                                     |
|---------------|----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>show ip bgp neighbors</b><br><b>Example:</b><br>Device# show ip bgp neighbors | Verifies the reset by checking information about the routing table and about BGP neighbors. |

## Configuring BGP Decision Attributes

### Procedure

|               | Command or Action                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                       |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                | Enters the global configuration mode.                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>router bgp <i>autonomous-system</i></b><br><b>Example:</b><br>Device(config)# router bgp 4500                                                                 | Enables a BGP routing process, assign it an AS number, and enter router configuration mode.                                                                                                                                                                                   |
| <b>Step 3</b> | <b>bgp best-path as-path ignore</b><br><b>Example:</b><br>Device(config-router)# bgp bestpath as-path ignore                                                     | (Optional) Configures the router to ignore AS path length in selecting a route.                                                                                                                                                                                               |
| <b>Step 4</b> | <b>neighbor {<i>ip-address</i>   <i>peer-group-name</i>} next-hop-self</b><br><b>Example:</b><br>Device(config-router)# neighbor 10.108.1.1<br>next-hop-self     | (Optional) Disables next-hop processing on BGP updates to a neighbor by entering a specific IP address to be used instead of the next-hop address.                                                                                                                            |
| <b>Step 5</b> | <b>neighbor {<i>ip-address</i>   <i>peer-group-name</i>} weight <i>weight</i></b><br><b>Example:</b><br>Device(config-router)# neighbor 172.16.12.1 weight<br>50 | (Optional) Assign a weight to a neighbor connection. Acceptable values are from 0 to 65535; the largest weight is the preferred route. Routes learned through another BGP peer have a default weight of 0; routes sourced by the local router have a default weight of 32768. |
| <b>Step 6</b> | <b>default-metric <i>number</i></b><br><b>Example:</b><br>Device(config-router)# default-metric 300                                                              | (Optional) Sets a MED metric to set preferred paths to external neighbors. All routes without a MED will also be set to this value. The range is 1 to 4294967295. The lowest value is the most desirable.                                                                     |

|                | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 7</b>  | <b>bgp bestpath med missing-as-worst</b><br><b>Example:</b><br><pre>Device(config-router)# bgp bestpath med missing-as-worst</pre>        | (Optional) Configures the switch to consider a missing MED as having a value of infinity, making the path without a MED value the least desirable path.                                                                                                                                                                                                                           |
| <b>Step 8</b>  | <b>bgp always-compare med</b><br><b>Example:</b><br><pre>Device(config-router)# bgp always-compare-med</pre>                              | (Optional) Configures the switch to compare MEDs for paths from neighbors in different autonomous systems. By default, MED comparison is only done among paths in the same AS.                                                                                                                                                                                                    |
| <b>Step 9</b>  | <b>bgp bestpath med confed</b><br><b>Example:</b><br><pre>Device(config-router)# bgp bestpath med confed</pre>                            | (Optional) Configures the switch to consider the MED in choosing a path from among those advertised by different subautonomous systems within a confederation.                                                                                                                                                                                                                    |
| <b>Step 10</b> | <b>bgp deterministic med</b><br><b>Example:</b><br><pre>Device(config-router)# bgp deterministic med</pre>                                | (Optional) Configures the switch to consider the MED variable when choosing among routes advertised by different peers in the same AS.                                                                                                                                                                                                                                            |
| <b>Step 11</b> | <b>bgp default local-preference <i>value</i></b><br><b>Example:</b><br><pre>Device(config-router)# bgp default local-preference 200</pre> | (Optional) Change the default local preference value. The range is 0 to 4294967295; the default value is 100. The highest local preference value is preferred.                                                                                                                                                                                                                    |
| <b>Step 12</b> | <b>maximum-paths <i>number</i></b><br><b>Example:</b><br><pre>Device(config-router)# maximum-paths 8</pre>                                | (Optional) Configures the number of paths to be added to the IP routing table. The default is to only enter the best path in the routing table. The range is from 1 to 16. Having multiple paths allows load-balancing among the paths. (Although the switch software allows a maximum of 32 equal-cost routes, the switch hardware will never use more than 16 paths per route.) |
| <b>Step 13</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                                           | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 14</b> | <b>show ip bgp</b><br><b>Example:</b><br><pre>Device# show ip bgp</pre>                                                                   | Verifies the reset by checking information about the routing table and about BGP neighbors.                                                                                                                                                                                                                                                                                       |
| <b>Step 15</b> | <b>show ip bgp neighbors</b><br><b>Example:</b>                                                                                           | Verifies the reset by checking information about the routing table and about BGP neighbors.                                                                                                                                                                                                                                                                                       |

|                | Command or Action                                                                                                 | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | Device# show ip bgp neighbors                                                                                     |                                                          |
| <b>Step 16</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Configuring BGP Filtering with Route Maps

### Procedure

|               | Command or Action                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                      | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>route-map map-tag [permit   deny] [sequence-number]</b><br><b>Example:</b><br>Device(config)# <b>route-map set-peer-address permit</b><br><b>10</b> | Creates a route map, and enter route-map configuration mode.                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>set ip next-hop ip-address [...ip-address] [peer-address]</b><br><b>Example:</b><br>Device(config)# <b>set ip next-hop 10.1.1.3</b>                 | (Optional) Sets a route map to disable next-hop processing <ul style="list-style-type: none"> <li>• In an inbound route map, set the next hop of matching routes to be the neighbor peering address, overriding third-party next hops.</li> <li>• In an outbound route map of a BGP peer, set the next hop to the peering address of the local router, disabling the next-hop calculation.</li> </ul> |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 5</b> | <b>show route-map [map-name]</b><br><b>Example:</b><br>Device# <b>show route-map</b>                                                                   | Displays all route maps configured or only the one specified to verify configuration.                                                                                                                                                                                                                                                                                                                 |

|        | Command or Action                                                                                                       | Purpose                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 6 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring BGP Filtering by Neighbor

### Procedure

|        | Command or Action                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                      |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                                                                             | Enters the global configuration mode.                                                                                                                                                                                                                                        |
| Step 2 | <b>router bgp <i>autonomous-system</i></b><br><b>Example:</b><br>Device(config)# <code>router bgp 109</code>                                                                                                                                        | Enables a BGP routing process, assign it an AS number, and enter router configuration mode.                                                                                                                                                                                  |
| Step 3 | <b>neighbor {<i>ip-address</i>   <i>peer-group name</i>} distribute-list {<i>access-list-number</i>   <i>name</i>} {<i>in</i>   <i>out</i>}</b><br><b>Example:</b><br>Device(config-router)# <code>neighbor 172.16.4.1 distribute-list 39 in</code> | (Optional) Filters BGP routing updates to or from neighbors as specified in an access list.<br><b>Note</b> You can also use the <b>neighbor prefix-list</b> router configuration command to filter updates, but you cannot use both commands to configure the same BGP peer. |
| Step 4 | <b>neighbor {<i>ip-address</i>   <i>peer-group name</i>} route-map <i>map-tag</i> {<i>in</i>   <i>out</i>}</b><br><b>Example:</b><br>Device(config-router)# <code>neighbor 172.16.70.24 route-map internal-map in</code>                            | (Optional) Applies a route map to filter an incoming or outgoing route.                                                                                                                                                                                                      |
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                                                                                                   | Returns to privileged EXEC mode.                                                                                                                                                                                                                                             |
| Step 6 | <b>show ip bgp neighbors</b><br><b>Example:</b>                                                                                                                                                                                                     | Verifies the configuration.                                                                                                                                                                                                                                                  |

|               | Command or Action                                                                                          | Purpose                                                  |
|---------------|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | Device# show ip bgp neighbors                                                                              |                                                          |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

## Configuring BGP Filtering by Access Lists and Neighbors

Another method of filtering is to specify an access list filter on both incoming and outbound updates, based on the BGP autonomous system paths. Each filter is an access list based on regular expressions. (See the “Regular Expressions” appendix in the *Cisco IOS Dial Technologies Command Reference, Release 12.4* for more information on forming regular expressions.) To use this method, define an autonomous system path access list, and apply it to updates to and from particular neighbors.

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                        | Purpose                                           |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                                                                                                                               | Enters the global configuration mode.             |
| <b>Step 2</b> | <b>ip as-path access-list</b> <i>access-list-number</i> { <b>permit</b>   <b>deny</b> }<br><i>as-regular-expressions</i><br><b>Example:</b><br>Device(config)# ip as-path access-list 1 deny<br>_65535_                                                                  | Defines a BGP-related access list.                |
| <b>Step 3</b> | <b>router bgp</b> <i>autonomous-system</i><br><b>Example:</b><br>Device(config)# router bgp 110                                                                                                                                                                          | Enters BGP router configuration mode.             |
| <b>Step 4</b> | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group name</i> } <b>filter-list</b><br>{ <i>access-list-number</i>   <i>name</i> } { <b>in</b>   <b>out</b>   <b>weight weight</b> }<br><b>Example:</b><br>Device(config-router)# neighbor 172.16.1.1<br>filter-list 1 out | Establishes a BGP filter based on an access list. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b>                                                                                                                                                                                                                                            | Returns to privileged EXEC mode.                  |

|               | Command or Action                                                                                                    | Purpose                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | Device(config)# <b>end</b>                                                                                           |                                                          |
| <b>Step 6</b> | <b>show ip bgp neighbors</b> [ <i>paths regular-expression</i> ]<br><b>Example:</b><br>Device# show ip bgp neighbors | Verifies the configuration.                              |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>    | (Optional) Saves your entries in the configuration file. |

## Configuring Prefix Lists for BGP Filtering

You do not need to specify a sequence number when removing a configuration entry. **Show** commands include the sequence numbers in their output.

Before using a prefix list in a command, you must set up the prefix list.

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                                   | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>ip prefix-list</b> <i>list-name</i> [ <b>seq</b> <i>seq-value</i> ] <b>deny</b>   <b>permit</b> <i>network/len</i> [ <b>ge</b> <i>ge-value</i> ] [ <b>le</b> <i>le-value</i> ]<br><b>Example:</b><br>Device(config)# ip prefix-list BLUE permit 172.16.1.0/24    | Creates a prefix list with an optional sequence number to <b>deny</b> or <b>permit</b> access for matching conditions. You must enter at least one <b>permit</b> or <b>deny</b> clause. <ul style="list-style-type: none"> <li><i>network/len</i> is the network number and length (in bits) of the network mask.</li> <li>(Optional) <b>ge</b> and <b>le</b> values specify the range of the prefix length to be matched. The specified <i>ge-value</i> and <i>le-value</i> must satisfy this condition: <math>len &lt; ge\text{-value} &lt; le\text{-value} &lt; 32</math></li> </ul> |
| <b>Step 3</b> | <b>ip prefix-list</b> <i>list-name</i> <b>seq</b> <i>seq-value</i> <b>deny</b>   <b>permit</b> <i>network/len</i> [ <b>ge</b> <i>ge-value</i> ] [ <b>le</b> <i>le-value</i> ]<br><b>Example:</b><br>Device(config)# ip prefix-list BLUE seq 10 permit 172.24.1.0/24 | (Optional) Adds an entry to a prefix list, and assign a sequence number to the entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|               | Command or Action                                                                                                                                                    | Purpose                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                          | Returns to privileged EXEC mode.                                                                 |
| <b>Step 5</b> | <b>show ip prefix list [detail   summary] name [network/len] [seq seq-num] [longer] [first-match]</b><br><b>Example:</b><br>Device# show ip prefix list summary test | Verifies the configuration by displaying information about a prefix list or prefix list entries. |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config                                                           | (Optional) Saves your entries in the configuration file.                                         |

## Configuring BGP Community Filtering

By default, no COMMUNITIES attribute is sent to a neighbor. You can specify that the COMMUNITIES attribute be sent to the neighbor at an IP address by using the **neighbor send-community** router configuration command.

### SUMMARY STEPS

1. **configure terminal**
2. **ip community-list community-list-number {permit | deny} community-number**
3. **router bgp autonomous-system**
4. **neighbor {ip-address | peer-group name} send-community**
5. **set comm-list list-num delete**
6. **exit**
7. **ip bgp-community new-format**
8. **end**
9. **show ip bgp community**
10. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                 | Purpose                               |
|---------------|-----------------------------------------------------------------------------------|---------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b> | Enters the global configuration mode. |

|        | Command or Action                                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <p><b>ip community-list</b> <i>community-list-number</i> {<b>permit</b>   <b>deny</b>} <i>community-number</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip community-list 1 permit 50000:10</pre> | <p>Creates a community list, and assigns it a number.</p> <ul style="list-style-type: none"> <li>The <i>community-list-number</i> is an integer from 1 to 99 that identifies one or more permit or deny groups of communities.</li> <li>The <i>community-number</i> is the number configured by a <b>set community</b> route-map configuration command.</li> </ul> |
| Step 3 | <p><b>router bgp</b> <i>autonomous-system</i></p> <p><b>Example:</b></p> <pre>Device(config)# router bgp 108</pre>                                                                                       | Enters BGP router configuration mode.                                                                                                                                                                                                                                                                                                                              |
| Step 4 | <p><b>neighbor</b> {<i>ip-address</i>   <i>peer-group name</i>} <b>send-community</b></p> <p><b>Example:</b></p> <pre>Device(config-router)# neighbor 172.16.70.23 send-community</pre>                  | Specifies that the COMMUNITIES attribute be sent to the neighbor at this IP address.                                                                                                                                                                                                                                                                               |
| Step 5 | <p><b>set comm-list</b> <i>list-num</i> <b>delete</b></p> <p><b>Example:</b></p> <pre>Device(config-router)# set comm-list 500 delete</pre>                                                              | (Optional) Removes communities from the community attribute of an inbound or outbound update that match a standard or extended community list specified by a route map.                                                                                                                                                                                            |
| Step 6 | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-router)# end</pre>                                                                                                                          | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                              |
| Step 7 | <p><b>ip bgp-community new-format</b></p> <p><b>Example:</b></p> <pre>Device(config)# ip bgp-community new format</pre>                                                                                  | <p>(Optional) Displays and parses BGP communities in the format AA:NN.</p> <p>A BGP community is displayed in a two-part format 2 bytes long. The Cisco default community format is in the format NNAA. In the most recent RFC for BGP, a community takes the form AA:NN, where the first part is the AS number and the second part is a 2-byte number.</p>        |
| Step 8 | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                   |
| Step 9 | <p><b>show ip bgp community</b></p> <p><b>Example:</b></p> <pre>Device# show ip bgp community</pre>                                                                                                      | Verifies the configuration.                                                                                                                                                                                                                                                                                                                                        |

|                | Command or Action                                                                                                       | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring BGP Neighbors and Peer Groups

To assign configuration options to an individual neighbor, specify any of these router configuration commands by using the neighbor IP address. To assign the options to a peer group, specify any of the commands by using the peer group name. You can disable a BGP peer or peer group without removing all the configuration information by using the **neighbor shutdown** router configuration command.

### Procedure

|                | Command or Action                                                                                                            | Purpose                                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b>  | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                      | Enters the global configuration mode.                                                                                                                                                          |
| <b>Step 2</b>  | <b>router bgp</b> <i>autonomous-system</i>                                                                                   | Enters BGP router configuration mode.                                                                                                                                                          |
| <b>Step 3</b>  | <b>neighbor</b> <i>peer-group-name</i> <b>peer-group</b>                                                                     | Creates a BGP peer group.                                                                                                                                                                      |
| <b>Step 4</b>  | <b>neighbor</b> <i>ip-address</i> <b>peer-group</b> <i>peer-group-name</i>                                                   | Makes a BGP neighbor a member of the peer group.                                                                                                                                               |
| <b>Step 5</b>  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>number</i>                                | Specifies a BGP neighbor. If a peer group is not configured with a <b>remote-as</b> <i>number</i> , use this command to create peer groups containing EBGP neighbors. The range is 1 to 65535. |
| <b>Step 6</b>  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>description</b> <i>text</i>                                | (Optional) Associates a description with a neighbor.                                                                                                                                           |
| <b>Step 7</b>  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>default-originate</b> [ <b>route-map</b> <i>map-name</i> ] | (Optional) Allows a BGP speaker (the local router) to send the default route 0.0.0.0 to a neighbor for use as a default route.                                                                 |
| <b>Step 8</b>  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>send-community</b>                                         | (Optional) Specifies that the COMMUNITIES attribute be sent to the neighbor at this IP address.                                                                                                |
| <b>Step 9</b>  | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>update-source</b> <i>interface</i>                         | (Optional) Allows internal BGP sessions to use any operational interface for TCP connections.                                                                                                  |
| <b>Step 10</b> | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>ebgp-multihop</b>                                          | (Optional) Allows BGP sessions, even when the neighbor is not on a directly connected segment. The multihop                                                                                    |

|         | Command or Action                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         |                                                                                                                                                                      | session is not established if the only route to the multihop peer's address is the default route (0.0.0.0).                                                                                                                                                                                                                                                                                                                                                    |
| Step 11 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>local-as</b> <i>number</i>                                                                         | (Optional) Specifies an AS number to use as the local AS. The range is 1 to 65535.                                                                                                                                                                                                                                                                                                                                                                             |
| Step 12 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>advertisement-interval</b> <i>seconds</i>                                                          | (Optional) Sets the minimum interval between sending BGP routing updates.                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 13 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>maximum-prefix</b> <i>maximum</i> [ <i>threshold</i> ]                                             | (Optional) Controls how many prefixes can be received from a neighbor. The range is 1 to 4294967295. The <i>threshold</i> (optional) is the percentage of maximum at which a warning message is generated. The default is 75 percent.                                                                                                                                                                                                                          |
| Step 14 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>next-hop-self</b>                                                                                  | (Optional) Disables next-hop processing on the BGP updates to a neighbor.                                                                                                                                                                                                                                                                                                                                                                                      |
| Step 15 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>password</b> <i>string</i>                                                                         | (Optional) Sets MD5 authentication on a TCP connection to a BGP peer. The same password must be configured on both BGP peers, or the connection between them is not made.                                                                                                                                                                                                                                                                                      |
| Step 16 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>route-map</b> <i>map-name</i> { <b>in</b>   <b>out</b> }                                           | (Optional) Applies a route map to incoming or outgoing routes.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Step 17 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>send-community</b>                                                                                 | (Optional) Specifies that the COMMUNITIES attribute be sent to the neighbor at this IP address.                                                                                                                                                                                                                                                                                                                                                                |
| Step 18 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>timers</b> <i>keepalive holdtime</i>                                                               | (Optional) Sets timers for the neighbor or peer group. <ul style="list-style-type: none"> <li>The <i>keepalive</i> interval is the time within which keepalive messages are sent to peers. The range is 1 to 4294967295 seconds; the default is 60.</li> <li>The <i>holdtime</i> is the interval after which a peer is declared inactive after not receiving a keepalive message from it. The range is 1 to 4294967295 seconds; the default is 180.</li> </ul> |
| Step 19 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>weight</b> <i>weight</i>                                                                           | (Optional) Specifies a weight for all routes from a neighbor.                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 20 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>distribute-list</b> { <i>access-list-number</i>   <i>name</i> } { <b>in</b>   <b>out</b> }         | (Optional) Filter BGP routing updates to or from neighbors, as specified in an access list.                                                                                                                                                                                                                                                                                                                                                                    |
| Step 21 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>filter-list</b> <i>access-list-number</i> { <b>in</b>   <b>out</b>   <b>weight</b> <i>weight</i> } | (Optional) Establish a BGP filter.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 22 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>version</b> <i>value</i>                                                                           | (Optional) Specifies the BGP version to use when communicating with a neighbor.                                                                                                                                                                                                                                                                                                                                                                                |
| Step 23 | <b>neighbor</b> { <i>ip-address</i>   <i>peer-group-name</i> } <b>soft-reconfiguration</b> <b>inbound</b>                                                            | (Optional) Configures the software to start storing received updates.                                                                                                                                                                                                                                                                                                                                                                                          |

|                | Command or Action                                                                                                     | Purpose                                                  |
|----------------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 24</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                         |
| <b>Step 25</b> | <b>show ip bgp neighbors</b>                                                                                          | Verifies the configuration.                              |
| <b>Step 26</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Configuring Aggregate Addresses in a Routing Table

### Procedure

|               | Command or Action                                                                                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                                                       | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>router bgp <i>autonomous-system</i></b><br><b>Example:</b><br><br>Device(config)# <b>router bgp 106</b>                                                  | Enters BGP router configuration mode.                                                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | <b>aggregate-address <i>address mask</i></b><br><b>Example:</b><br><br>Device(config-router)# <b>aggregate-address 10.0.0.0<br/>255.0.0.0</b>               | Creates an aggregate entry in the BGP routing table. The aggregate route is advertised as coming from the AS, and the atomic aggregate attribute is set to indicate that information might be missing.                                                                                                                                                 |
| <b>Step 4</b> | <b>aggregate-address <i>address mask as-set</i></b><br><b>Example:</b><br><br>Device(config-router)# <b>aggregate-address 10.0.0.0<br/>255.0.0.0 as-set</b> | (Optional) Generates AS set path information. This command creates an aggregate entry following the same rules as the previous command, but the advertised path will be an AS_SET consisting of all elements contained in all paths. Do not use this keyword when aggregating many paths because this route must be continually withdrawn and updated. |
| <b>Step 5</b> | <b>aggregate-address <i>address-mask summary-only</i></b><br><b>Example:</b>                                                                                | (Optional) Advertises summary addresses only.                                                                                                                                                                                                                                                                                                          |

|                | Command or Action                                                                                                                                                            | Purpose                                                                           |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
|                | Device(config-router)# aggregate-address 10.0.0.0<br>255.0.0.0 summary-only                                                                                                  |                                                                                   |
| <b>Step 6</b>  | <b>aggregate-address address mask suppress-map map-name</b><br><br><b>Example:</b><br><br>Device(config-router)# aggregate-address 10.0.0.0<br>255.0.0.0 suppress-map map1   | (Optional) Suppresses selected, more specific routes.                             |
| <b>Step 7</b>  | <b>aggregate-address address mask advertise-map map-name</b><br><br><b>Example:</b><br><br>Device(config-router)# aggregate-address 10.0.0.0<br>255.0.0.0 advertise-map map2 | (Optional) Generates an aggregate based on conditions specified by the route map. |
| <b>Step 8</b>  | <b>aggregate-address address mask attribute-map map-name</b><br><br><b>Example:</b><br><br>Device(config-router)# aggregate-address 10.0.0.0<br>255.0.0.0 attribute-map map3 | (Optional) Generates an aggregate with attributes specified in the route map.     |
| <b>Step 9</b>  | <b>end</b><br><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                                                                          | Returns to privileged EXEC mode.                                                  |
| <b>Step 10</b> | <b>show ip bgp neighbors [advertised-routes]</b><br><br><b>Example:</b><br><br>Device# show ip bgp neighbors                                                                 | Verifies the configuration.                                                       |
| <b>Step 11</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b>                                                    | (Optional) Saves your entries in the configuration file.                          |

## Configuring Routing Domain Confederations

You must specify a confederation identifier that acts as the autonomous system number for the group of autonomous systems.

## Procedure

|               | Command or Action                                                                                                                                                                                     | Purpose                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                                                                                                 | Enters the global configuration mode.                                                                             |
| <b>Step 2</b> | <b>router bgp <i>autonomous-system</i></b><br><b>Example:</b><br><br>Device(config)# <b>router bgp 100</b>                                                                                            | Enters BGP router configuration mode.                                                                             |
| <b>Step 3</b> | <b>bgp confederation identifier <i>autonomous-system</i></b><br><b>Example:</b><br><br>Device(config)# <b>bgp confederation identifier 50007</b>                                                      | Configures a BGP confederation identifier.                                                                        |
| <b>Step 4</b> | <b>bgp confederation peers <i>autonomous-system</i></b><br><b>[<i>autonomous-system ...</i>]</b><br><b>Example:</b><br><br>Device(config)# <b>bgp confederation peers 51000 51001</b><br><b>51002</b> | Specifies the autonomous systems that belong to the confederation and that will be treated as special EBGP peers. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                                                                                                       | Returns to privileged EXEC mode.                                                                                  |
| <b>Step 6</b> | <b>show ip bgp neighbor</b><br><b>Example:</b><br><br>Device# <b>show ip bgp neighbor</b>                                                                                                             | Verifies the configuration.                                                                                       |
| <b>Step 7</b> | <b>show ip bgp network</b><br><b>Example:</b><br><br>Device# <b>show ip bgp network</b>                                                                                                               | Verifies the configuration.                                                                                       |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b>                                                                                 | (Optional) Saves your entries in the configuration file.                                                          |

## Configuring BGP Route Reflectors

### Procedure

|               | Command or Action                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                               |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                                              | Enters the global configuration mode.                                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>router bgp <i>autonomous-system</i></b><br><b>Example:</b><br>Device(config)# <code>router bgp 101</code>                                                                                                         | Enters BGP router configuration mode.                                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>neighbor {<i>ip-address</i>   <i>peer-group-name</i>}</b><br><b>route-reflector-client</b><br><b>Example:</b><br>Device(config-router)# <code>neighbor 172.16.70.24</code><br><code>route-reflector-client</code> | Configures the local router as a BGP route reflector and the specified neighbor as a client.                                                                                                                                                          |
| <b>Step 4</b> | <b>bgp cluster-id <i>cluster-id</i></b><br><b>Example:</b><br>Device(config-router)# <code>bgp cluster-id 10.0.1.2</code>                                                                                            | (Optional) Configures the cluster ID if the cluster has more than one route reflector.                                                                                                                                                                |
| <b>Step 5</b> | <b>no bgp client-to-client reflection</b><br><b>Example:</b><br>Device(config-router)# <code>no bgp client-to-client</code><br><code>reflection</code>                                                               | (Optional) Disables client-to-client route reflection. By default, the routes from a route reflector client are reflected to other clients. However, if the clients are fully meshed, the route reflector does not need to reflect routes to clients. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                      |
| <b>Step 7</b> | <b>show ip bgp</b><br><b>Example:</b><br>Device# <code>show ip bgp</code>                                                                                                                                            | Verifies the configuration. Displays the originator ID and the cluster-list attributes.                                                                                                                                                               |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><b>Example:</b>                                                                                                                                                         | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                              |

|  | Command or Action                                       | Purpose |
|--|---------------------------------------------------------|---------|
|  | Device# <code>copy running-config startup-config</code> |         |

## Configuring Route Dampening

### Procedure

|               | Command or Action                                                                                                                                                                                                      | Purpose                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                                                | Enters the global configuration mode.                                                                                                    |
| <b>Step 2</b> | <b>router bgp <i>autonomous-system</i></b><br><b>Example:</b><br>Device(config)# <code>router bgp 100</code>                                                                                                           | Enters BGP router configuration mode.                                                                                                    |
| <b>Step 3</b> | <b>bgp dampening</b><br><b>Example:</b><br>Device(config-router)# <code>bgp dampening</code>                                                                                                                           | Enables BGP route dampening.                                                                                                             |
| <b>Step 4</b> | <b>bgp dampening <i>half-life reuse suppress max-suppress</i></b><br><b>[route-map <i>map</i>]</b><br><b>Example:</b><br>Device(config-router)# <code>bgp dampening 30 1500 10000 120</code>                           | (Optional) Changes the default values of route dampening factors.                                                                        |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                                                                      | Returns to privileged EXEC mode.                                                                                                         |
| <b>Step 6</b> | <b>show ip bgp flap-statistics</b> [ <b>{regexp <i>regexp</i>}</b>   <b>{filter-list <i>list</i>}</b>   <b>{address mask [longer-prefix]}</b> ]<br><b>Example:</b><br>Device# <code>show ip bgp flap-statistics</code> | (Optional) Monitors the flaps of all paths that are flapping. The statistics are deleted when the route is not suppressed and is stable. |
| <b>Step 7</b> | <b>show ip bgp dampened-paths</b><br><b>Example:</b>                                                                                                                                                                   | (Optional) Displays the dampened routes, including the time remaining before they are suppressed.                                        |

|                | Command or Action                                                                                                                                                                                                        | Purpose                                                                                     |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
|                | Device# show pi bgp dampened-paths                                                                                                                                                                                       |                                                                                             |
| <b>Step 8</b>  | <b>clear ip bgp flap-statistics</b> [ { <b>regexp</b> <i>regexp</i> }   { <b>filter-list</b> <i>list</i> }   { <b>address mask</b> [ <b>longer-prefix</b> ] }<br><b>Example:</b><br>Device# clear ip bgp flap-statistics | (Optional) Clears BGP flap statistics to make it less likely that a route will be dampened. |
| <b>Step 9</b>  | <b>clear ip bgp dampening</b><br><b>Example:</b><br>Device# clear ip bgp dampening                                                                                                                                       | (Optional) Clears route dampening information, and unsuppress the suppressed routes.        |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config                                                                                                               | (Optional) Saves your entries in the configuration file.                                    |

## Monitoring and Maintaining BGP

You can remove all contents of a particular cache, table, or database. This might be necessary when the contents of the particular structure have become or are suspected to be invalid.

You can display specific statistics, such as the contents of BGP routing tables, caches, and databases. You can use the information to get resource utilization and solve network problems. You can also display information about node reachability and discover the routing path your device's packets are taking through the network.

The table given below lists the privileged EXEC commands for clearing and displaying BGP. For explanations of the display fields, see the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4*.

**Table 112: IP BGP Clear and Show Commands**

|                                                                           |                                                                                                                                                                       |
|---------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>clear ip bgp</b> <i>address</i>                                        | Resets a particular BGP connection.                                                                                                                                   |
| <b>clear ip bgp</b> *                                                     | Resets all BGP connections.                                                                                                                                           |
| <b>clear ip bgp peer-group</b> <i>tag</i>                                 | Removes all members of a BGP peer group.                                                                                                                              |
| <b>show ip bgp</b> <i>prefix</i>                                          | Displays peer groups and peers not in peer groups to which the prefix has been advertised. Also displays prefix attributes such as the next hop and the local prefix. |
| <b>show ip bgp cidr-only</b>                                              | Displays all BGP routes that contain subnet and supernet network masks.                                                                                               |
| <b>show ip bgp community</b> [ <i>community-number</i> ] [ <b>exact</b> ] | Displays routes that belong to the specified communities.                                                                                                             |

|                                                                                                                                                                                                                  |                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>show ip bgp community-list</b> <i>community-list-number</i><br>[exact-match]                                                                                                                                  | Displays routes that are permitted by the community list.                                                           |
| <b>show ip bgp filter-list</b> <i>access-list-number</i>                                                                                                                                                         | Displays routes that are matched by the specified AS path access list.                                              |
| <b>show ip bgp inconsistent-as</b>                                                                                                                                                                               | Displays the routes with inconsistent originating autonomous systems.                                               |
| <b>show ip bgp regexp</b> <i>regular-expression</i>                                                                                                                                                              | Displays the routes that have an AS path that matches the specified regular expression entered on the command line. |
| <b>show ip bgp</b>                                                                                                                                                                                               | Displays the contents of the BGP routing table.                                                                     |
| <b>show ip bgp neighbors</b> [ <i>address</i> ]                                                                                                                                                                  | Displays detailed information on the BGP and TCP connections to individual neighbors.                               |
| <b>show ip bgp neighbors</b> [ <i>address</i> ] [ <b>advertised-routes</b>   <b>dampened-routes</b>   <b>flap-statistics</b>   <b>paths</b> <i>regular-expression</i>   <b>received-routes</b>   <b>routes</b> ] | Displays routes learned from a particular BGP neighbor.                                                             |
| <b>show ip bgp paths</b>                                                                                                                                                                                         | Displays all BGP paths in the database.                                                                             |
| <b>show ip bgp peer-group</b> [ <i>tag</i> ] [ <b>summary</b> ]                                                                                                                                                  | Displays information about BGP peer groups.                                                                         |
| <b>show ip bgp summary</b>                                                                                                                                                                                       | Displays the status of all BGP connections.                                                                         |

The **bgp log-neighbor changes** command is enabled by default. It allows to log messages that are generated when a BGP neighbor resets, comes up, or goes down.

## Configuration Examples for BGP

### Example: Configuring BGP on Routers

These examples show how to configure BGP on the routers in the figure below,

Figure 87: EBGP, IBGP, and Multiple Autonomous Systems

Router A:

```
Device(config)# router bgp 100
Device(config-router)# neighbor 129.213.1.1 remote-as 200
```

Router B:

```
Device(config)# router bgp 200
Device(config-router)# neighbor 129.213.1.2 remote-as 100
Device(config-router)# neighbor 175.220.1.2 remote-as 200
```

Router C:

```
Device(config)# router bgp 200
Device(config-router)# neighbor 175.220.212.1 remote-as 200
Device(config-router)# neighbor 192.208.10.1 remote-as 300
```

Router D:

```
Device(config)# router bgp 300
Device(config-router)# neighbor 192.208.10.2 remote-as 200
```

To verify that BGP peers are running, use the `show ip bgp neighbors` privileged EXEC command. This is the output of this command on Router A:

```
Device# show ip bgp neighbors

BGP neighbor is 129.213.1.1, remote AS 200, external link
 BGP version 4, remote router ID 175.220.212.1
 BGP state = established, table version = 3, up for 0:10:59
 Last read 0:00:29, hold time is 180, keepalive interval is 60 seconds
 Minimum time between advertisement runs is 30 seconds
 Received 2828 messages, 0 notifications, 0 in queue
 Sent 2826 messages, 0 notifications, 0 in queue
 Connections established 11; dropped 10
```

Anything other than `state = established` means that the peers are not running. The remote router ID is the highest IP address on that router (or the highest loopback interface). Each time the table is updated with new information, the table version number increments. A table version number that continually increments means that a route is flapping, causing continual routing updates.

For exterior protocols, a reference to an IP network from the **network** router configuration command controls only which networks are advertised. This is in contrast to Interior Gateway Protocols (IGPs), such as EIGRP, which also use the **network** command to specify where to send updates.

For detailed descriptions of BGP configuration, see the “IP Routing Protocols” part of the *Cisco IOS IP Configuration Guide, Release 12.4*. For details about specific commands, see the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4*.

## Information About ISO CLNS Routing

### Connectionless Routing

The International Organization for Standardization (ISO) Connectionless Network Service (CLNS) protocol is a standard for the network layer of the Open System Interconnection (OSI) model. Addresses in the ISO network architecture are referred to as network service access point (NSAP) addresses and network entity titles (NETs). Each node in an OSI network has one or more NETs. In addition, each node has many NSAP addresses.

When you enable connectionless routing on the Device by using the **clns routing** global configuration command, the Device makes only forwarding decisions, with no routing-related functionality. For dynamic routing, you must also enable a routing protocol. The Device supports the Intermediate System-to-Intermediate System (IS-IS) dynamic routing protocol that is based on the OSI routing protocol for ISO CLNS networks.

When dynamically routing, you use IS-IS. This routing protocol supports the concept of areas. Within an area, all routers know how to reach all the system IDs. Between areas, routers know how to reach the proper area. IS-IS supports two levels of routing: station routing (within an area) and area routing (between areas).

The key difference between the ISO IGRP and IS-IS NSAP addressing schemes is in the definition of area addresses. Both use the system ID for Level 1 routing (routing within an area). However, they differ in the way addresses are specified for area routing. An ISO IGRP NSAP address includes three separate fields for routing: the domain, area, and system ID. An IS-IS address includes two fields: a single continuous area field (comprising the domain and area fields) and the system ID.

**Note**

For more detailed information about ISO CLNS, see the *Cisco IOS Apollo Domain, Banyan VINES, DECnet, ISO CLNS and XNS Configuration Guide, Release 12.4*. For complete syntax and usage information for the commands used in this chapter, see the *Cisco IOS Apollo Domain, Banyan VINES, DECnet, ISO CLNS and XNS Command Reference, Release 12.4*, use the IOS command reference master index, or search online.

### Information About IS-IS Routing

IS-IS is an ISO dynamic routing protocol (described in ISO 105890). Compared to other routing protocols, to enable IS-IS you need to create an IS-IS routing process and assign it to a specific interface, rather than to a network. You can specify more than one IS-IS routing process per Layer 3 device by using the multiarea IS-IS configuration syntax. You then need to configure the parameters for each instance of the IS-IS routing process.

Small IS-IS networks are built as a single area that includes all the devices in the network. As the network grows larger, the network reorganizes itself into a backbone area made up of all the connected set of Level 2

devices still connected to their local areas. Within a local area, devices know how to reach all system IDs. Between areas, devices know how to reach the backbone, and the backbone devices know how to reach other areas.

Devices establish Level 1 adjacencies to perform routing within a local area (station routing). Devices establish Level 2 adjacencies to perform routing between Level 1 areas (area routing).

A single Cisco device can participate in routing in up to 29 areas and can perform Level 2 routing in the backbone. In general, each routing process corresponds to an area. By default, the first instance of the routing process that is configured performs both Level 1 and Level 2 routing. You can configure additional device instances, which are automatically treated as Level 1 areas. You must configure the parameters for each instance of the IS-IS routing process individually.

For IS-IS multiarea routing, you can configure only one process to perform Level 2 routing, although you can define up to 29 Level 1 areas for each Cisco unit. If Level 2 routing is configured on any process, all additional processes are automatically configured as Level 1. You can configure this process to perform Level 1 routing at the same time. If Level 2 routing is not desired for a device instance, remove the Level 2 capability using the **is-type** command in global configuration mode. Use the **is-type** command also to configure a different device instance as a Level 2 device.

## Nonstop Forwarding Awareness

The integrated IS-IS Nonstop Forwarding (NSF) Awareness feature is supported for IPv4G. The feature allows customer premises equipment (CPE) devices that are NSF-aware to help NSF-capable devices perform nonstop forwarding of packets. The local device is not necessarily performing NSF, but its NSF awareness capability allows the integrity and accuracy of the routing database and the link-state database on the neighboring NSF-capable device to be maintained during the switchover process.

The integrated IS-IS Nonstop Forwarding (NSF) Awareness feature is automatically enabled and requires no configuration.

## IS-IS Global Parameters

The following are the optional IS-IS global parameters that you can configure:

- You can force a default route into an IS-IS routing domain by configuring a default route that is controlled by a route map. You can also specify the other filtering options that are configurable under a route map.
- You can configure the device to ignore IS-IS link-state packets (LSPs) that are received with internal checksum errors, or to purge corrupted LSPs, and cause the initiator of the LSP to regenerate it.
- You can assign passwords to areas and domains.
- You can create aggregate addresses that are represented in the routing table by a summary address (based on route summarization). Routes learned from other routing protocols can also be summarized. The metric used to advertise the summary is the smallest metric of all the specific routes.
- You can set an overload bit.
- You can configure the LSP refresh interval and the maximum time that an LSP can remain in the device database without a refresh.
- You can set the throttling timers for LSP generation, shortest path first computation, and partial route computation.

- You can configure the device to generate a log message when an IS-IS adjacency changes state (Up or Down).
- If a link in the network has a maximum transmission unit (MTU) size of less than 1500 bytes, you can lower the LSP MTU so that routing still occurs.
- You can use the partition avoidance device configuration command to prevent an area from becoming partitioned when full connectivity is lost among a Level 1-2 border device, adjacent Level 1 devices, and end hosts.

## IS-IS Interface Parameters

You can optionally configure certain interface-specific IS-IS parameters independently from other attached devices. However, if you change default value, such as multipliers and time intervals, it makes sense to also change them on multiple devices and interfaces. Most of the interface parameters can be configured for level 1, level 2, or both.

The following are the interface-level parameters that you can configure:

- The default metric on the interface that is used as a value for the IS-IS metric and assigned when quality of service (QoS) routing is not performed.
- The hello interval (length of time between hello packets sent on the interface) or the default hello packet multiplier used on the interface to determine the hold time sent in IS-IS hello packets. The hold time determines how long a neighbor waits for another hello packet before declaring the neighbor down. This determines how quickly a failed link or neighbor is detected so that routes can be recalculated. Change the hello multiplier in circumstances where hello packets are lost frequently and IS-IS adjacencies are failing unnecessarily. You can raise the hello multiplier and lower the hello interval correspondingly to make the hello protocol more reliable, without increasing the time required to detect a link failure.
- Other time intervals:
  - Complete sequence number PDU (CSNP) interval—CSNPs are sent by the designated device to maintain database synchronization.
  - Retransmission interval—This is the time between retransmission of IS-IS LSPs for point-to-point links.
  - IS-IS LSP retransmission throttle interval—This is the maximum rate (number of milliseconds between packets) at which IS-IS LSPs are resent on point-to-point links. This interval is different from the retransmission interval, which is the time between successive retransmissions of the same LSP.
- Designated device-election priority, which allows you to reduce the number of adjacencies required on a multiaccess network, which in turn reduces the amount of routing protocol traffic and the size of the topology database.
- The interface circuit type, which is the type of adjacency required for neighbors on the specified interface.
- Password authentication for the interface.

# How to Configure ISO CLNS Routing

## Default IS-IS Configuration

*Table 113: Default IS-IS Configuration*

| Feature                                           | Default Setting                                                                                                                                                                                                                    |
|---------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Ignore link-state PDU (LSP) errors                | Enabled.                                                                                                                                                                                                                           |
| IS-IS type                                        | Conventional IS-IS—The router acts as both a Level 1 (station) and a Level 2 (area) router.<br><br>Multiarea IS-IS—The first instance of the IS-IS routing process is a Level 1-2 router. Remaining instances are Level 1 routers. |
| Default-information originate                     | Disabled.                                                                                                                                                                                                                          |
| Log IS-IS adjacency state changes.                | Disabled.                                                                                                                                                                                                                          |
| LSP generation throttling timers                  | Maximum interval between two consecutive occurrences—5 seconds.<br><br>Initial LSP generation delay—50 ms.<br><br>Hold time between the first and second LSP generation—5000 ms.                                                   |
| LSP maximum lifetime (without a refresh)          | 1200 seconds (20 minutes) before the LSP packet is deleted.                                                                                                                                                                        |
| LSP refresh interval                              | Every 900 seconds (15 minutes).                                                                                                                                                                                                    |
| Maximum LSP packet size                           | 1497 bytes.                                                                                                                                                                                                                        |
| NSF Awareness                                     | Enabled. Allows Layer 3 devices to continue forwarding packets from a neighboring Nonstop Forwarding-capable router during hardware or software changes.                                                                           |
| Partial route computation (PRC) throttling timers | Maximum PRC wait interval—5 seconds.<br><br>Initial PRC calculation delay after a topology change—2000 ms.<br><br>Hold time between the first and second PRC calculation—5000 ms.                                                  |
| Partition avoidance                               | Disabled.                                                                                                                                                                                                                          |
| Password                                          | No area or domain password is defined, and authentication is disabled.                                                                                                                                                             |

| Feature                                     | Default Setting                                                                                                                                                                      |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Set-overload-bit                            | Disabled. When enabled, if no arguments are entered, the overload bit is set immediately and remains set until you enter the <b>no set-overload-bit</b> command.                     |
| Shortest path first (SPF) throttling timers | Maximum interval between consecutive SFPs—10 seconds.<br>Initial SFP calculation after a topology change—5500 ms.<br>Hold time between the first and second SFP calculation—5500 ms. |
| Summary-address                             | Disabled.                                                                                                                                                                            |

## Enabling IS-IS Routing

To enable IS-IS, you specify a name and NET for each routing process. You then enable IS-IS routing on the interface and specify the area for each instance of the routing process.

### Procedure

|               | Command or Action                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <code>configure terminal</code>           | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>clns routing</b><br><b>Example:</b><br><br>Device(config)# <code>clns routing</code>               | Enables ISO connectionless routing on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>router isis [area tag]</b><br><b>Example:</b><br><br>Device(config)# <code>router isis tag1</code> | Enables the IS-IS routing for the specified routing process and enter IS-IS routing configuration mode.<br><br>(Optional) Use the <i>area tag</i> argument to identify the area to which the IS-IS router is assigned. You must enter a value if you are configuring multiple IS-IS areas.<br><br>The first IS-IS instance configured is Level 1-2 by default. Later instances are automatically Level 1. You can change the level of routing by using the <b>is-type</b> global configuration command. |
| <b>Step 4</b> | <b>net network-entity-title</b><br><b>Example:</b>                                                    | Configures the NETs for the routing process. If you are configuring multiarea IS-IS, specify a NET for each routing process. You can specify a name for a NET and for an address.                                                                                                                                                                                                                                                                                                                       |

|                | Command or Action                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <pre>Device(config-router)# net 47.0004.004d.0001.0001.0c11.1111.00</pre>                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 5</b>  | <p><b>is-type</b> {<i>level-1</i>   <i>level-1-2</i>   <i>level-2-only</i>}</p> <p><b>Example:</b></p> <pre>Device(config-router)# is-type level-2-only</pre> | <p>(Optional) Configures the router to act as a Level 1 (station) router, a Level 2 (area) router for multi-area routing, or both (the default):</p> <ul style="list-style-type: none"> <li>• <b>level-1</b>—act as a station router only</li> <li>• <b>level-1-2</b>—act as both a station router and an area router</li> <li>• <b>level 2</b>—act as an area router only</li> </ul> |
| <b>Step 6</b>  | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-router)# end</pre>                                                                               | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 7</b>  | <p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Device(config)# interface gigabitethernet 1/0/1</pre>                                 | Specifies an interface to route IS-IS, and enter interface configuration mode. If the interface is not already configured as a Layer 3 interface, enter the <b>no switchport</b> command to put it into Layer 3 mode.                                                                                                                                                                 |
| <b>Step 8</b>  | <p><b>ip router isis</b> [<i>area tag</i>]</p> <p><b>Example:</b></p> <pre>Device(config-if)# ip router isis tag1</pre>                                       | Configures an IS-IS routing process for ISO CLNS on the interface and attach an area designator to the routing process.                                                                                                                                                                                                                                                               |
| <b>Step 9</b>  | <p><b>clns router isis</b> [<i>area tag</i>]</p> <p><b>Example:</b></p> <pre>Device(config-if)# clns router isis tag1</pre>                                   | Enables ISO CLNS on the interface.                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 10</b> | <p><b>ip address</b> <i>ip-address-mask</i></p> <p><b>Example:</b></p> <pre>Device(config-if)# ip address 10.0.0.5 255.255.255.0</pre>                        | Define the IP address for the interface. An IP address is required on all interfaces in an area enabled for IS-IS if any one interface is configured for IS-IS routing.                                                                                                                                                                                                               |
| <b>Step 11</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 12</b> | <p><b>show isis</b> [<i>area tag</i>] <b>database detail</b></p> <p><b>Example:</b></p>                                                                       | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                |

|                | Command or Action                                                                                                 | Purpose                                                  |
|----------------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|                | Device# show isis database detail                                                                                 |                                                          |
| <b>Step 13</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Configuring IS-IS Global Parameters

### Procedure

|               | Command or Action                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                       |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                          | Enters the global configuration mode.                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>cls routing</b><br><b>Example:</b><br>Device(config)# <b>cls routing</b>                                                                                | Enables ISO connectionless routing on the switch.                                                                                                                                                                                                                             |
| <b>Step 3</b> | <b>router isis</b><br><b>Example:</b><br>Device(config)# <b>router isis</b>                                                                                | Specifies the IS-IS routing protocol and enters router configuration mode.                                                                                                                                                                                                    |
| <b>Step 4</b> | <b>default-information originate [route-map map-name]</b><br><b>Example:</b><br>Device(config-router)# <b>default-information originate route-map map1</b> | (Optional) Forces a default route into the IS-IS routing domain. If you enter <b>route-map map-name</b> , the routing process generates the default route if the route map is satisfied.                                                                                      |
| <b>Step 5</b> | <b>ignore-lsp-errors</b><br><b>Example:</b><br>Device(config-router)# <b>ignore-lsp-errors</b>                                                             | (Optional) Configures the router to ignore LSPs with internal checksum errors, instead of purging the LSPs. This command is enabled by default (corrupted LSPs are dropped). To purge the corrupted LSPs, enter the <b>no ignore-lsp-errors</b> router configuration command. |
| <b>Step 6</b> | <b>area-password password</b><br><b>Example:</b><br>Device(config-router)# <b>area-password lpassword</b>                                                  | (Optional) Configures the area authentication password, which is inserted in Level 1 (station router level) LSPs.                                                                                                                                                             |

|         | Command or Action                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 7  | <b>domain-password</b> <i>password</i><br><b>Example:</b><br><pre>Device(config-router)# domain-password 2password</pre>                                                               | (Optional) Configures the routing domain authentication password, which is inserted in Level 2 (area router level) LSPs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 8  | <b>summary-address</b> <i>address mask [level-1   level-1-2   level-2]</i><br><b>Example:</b><br><pre>Device(config-router)# summary-address 10.1.0.0 255.255.0.0 level-2</pre>        | (Optional) Creates a summary of addresses for a given level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 9  | <b>set-overload-bit</b> [ <b>on-startup</b> { <i>seconds</i>   <b>wait-for-bgp</b> }]<br><b>Example:</b><br><pre>Device(config-router)# set-overload-bit on-startup wait-for-bgp</pre> | (Optional) Sets an overload bit (a hippity bit) to allow other routers to ignore the router in their shortest path first (SPF) calculations if the router is having problems. <ul style="list-style-type: none"> <li>• (Optional) <b>on-startup</b>—sets the overload bit only on startup. If <b>on-startup</b> is not specified, the overload bit is set immediately and remains set until you enter the <b>no set-overload-bit</b> command. If <b>on-startup</b> is specified, you must enter a number of seconds or <b>wait-for-bgp</b>.</li> <li>• <i>seconds</i>—When the <b>on-startup</b> keyword is configured, causes the overload bit to be set upon system startup and remain set for this number of seconds. The range is from 5 to 86400 seconds.</li> <li>• <b>wait-for-bgp</b>—When the <b>on-startup</b> keyword is configured, causes the overload bit to be set upon system startup and remain set until BGP has converged. If BGP does not signal IS-IS that it is converged, IS-IS will turn off the overload bit after 10 minutes.</li> </ul> |
| Step 10 | <b>lsp-refresh-interval</b> <i>seconds</i><br><b>Example:</b><br><pre>Device(config-router)# lsp-refresh-interval 1080</pre>                                                           | (Optional) Sets an LSP refresh interval in seconds. The range is from 1 to 65535 seconds. The default is to send LSP refreshes every 900 seconds (15 minutes).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 11 | <b>max-lsp-lifetime</b> <i>seconds</i><br><b>Example:</b><br><pre>Device(config-router)# max-lsp-lifetime 1000</pre>                                                                   | (Optional) Sets the maximum time that LSP packets remain in the router database without being refreshed. The range is from 1 to 65535 seconds. The default is 1200 seconds (20 minutes). After the specified time interval, the LSP packet is deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Step 12 | <b>lsp-gen-interval</b> [ <b>level-1</b>   <b>level-2</b> ] <i>lsp-max-wait [lsp-initial-wait lsp-second-wait]</i><br><b>Example:</b>                                                  | (Optional) Sets the IS-IS LSP generation throttling timers: <ul style="list-style-type: none"> <li>• <i>lsp-max-wait</i>—the maximum interval (in seconds) between two consecutive occurrences of an LSP being generated. The range is 1 to 120, the default is 5.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                | Command or Action                                                                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <pre>Device(config-router)# lsp-gen-interval level-2 2 50 100</pre>                                                                                                                                       | <ul style="list-style-type: none"> <li>• <i>lsp-initial-wait</i>—the initial LSP generation delay (in milliseconds). The range is 1 to 10000; the default is 50.</li> <li>• <i>lsp-second-wait</i>—the hold time between the first and second LSP generation (in milliseconds). The range is 1 to 10000; the default is 5000.</li> </ul>                                                                                                                                                                                                                                                                   |
| <b>Step 13</b> | <p><b>spf-interval</b> [level-1   level-2] <i>spf-max-wait</i> [<i>spf-initial-wait</i> <i>spf-second-wait</i>]</p> <p><b>Example:</b></p> <pre>Device(config-router)# spf-interval level-2 5 10 20</pre> | <p>(Optional) Sets IS-IS shortest path first (SPF) throttling timers.</p> <ul style="list-style-type: none"> <li>• <i>spf-max-wait</i>—the maximum interval between consecutive SFPs (in seconds). The range is 1 to 120, the default is 10.</li> <li>• <i>spf-initial-wait</i>—the initial SFP calculation after a topology change (in milliseconds). The range is 1 to 10000; the default is 5500.</li> <li>• <i>spf-second-wait</i>—the holdtime between the first and second SFP calculation (in milliseconds). The range is 1 to 10000; the default is 5500.</li> </ul>                               |
| <b>Step 14</b> | <p><b>prc-interval</b> <i>prc-max-wait</i> [<i>prc-initial-wait</i> <i>prc-second-wait</i>]</p> <p><b>Example:</b></p> <pre>Device(config-router)# prc-interval 5 10 20</pre>                             | <p>(Optional) Sets IS-IS partial route computation (PRC) throttling timers.</p> <ul style="list-style-type: none"> <li>• <i>prc-max-wait</i>—the maximum interval (in seconds) between two consecutive PRC calculations. The range is 1 to 120; the default is 5.</li> <li>• <i>prc-initial-wait</i>—the initial PRC calculation delay (in milliseconds) after a topology change. The range is 1 to 10,000; the default is 2000.</li> <li>• <i>prc-second-wait</i>—the hold time between the first and second PRC calculation (in milliseconds). The range is 1 to 10,000; the default is 5000.</li> </ul> |
| <b>Step 15</b> | <p><b>log-adjacency-changes</b> [all]</p> <p><b>Example:</b></p> <pre>Device(config-router)# log-adjacency-changes all</pre>                                                                              | <p>(Optional) Sets the router to log IS-IS adjacency state changes. Enter <b>all</b> to include all changes generated by events that are not related to the Intermediate System-to-Intermediate System Hellos, including End System-to-Intermediate System PDUs and link state packets (LSPs).</p>                                                                                                                                                                                                                                                                                                         |
| <b>Step 16</b> | <p><b>lsp-mtu</b> <i>size</i></p> <p><b>Example:</b></p> <pre>Device(config-router)# lsp mtu 1560</pre>                                                                                                   | <p>(Optional) Specifies the maximum LSP packet size in bytes. The range is 128 to 4352; the default is 1497 bytes.</p> <p><b>Note</b> If any link in the network has a reduced MTU size, you must change the LSP MTU size on all routers in the network.</p>                                                                                                                                                                                                                                                                                                                                               |

|         | Command or Action                                                                                          | Purpose                                                                                                                                                                                                                       |
|---------|------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 17 | <b>partition avoidance</b><br><b>Example:</b><br>Device(config-router)# partition avoidance                | (Optional) Causes an IS-IS Level 1-2 border router to stop advertising the Level 1 area prefix into the Level 2 backbone when full connectivity is lost among the border router, all adjacent level 1 routers, and end hosts. |
| Step 18 | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                              |
| Step 19 | <b>show clns</b><br><b>Example:</b><br>Device# show clns                                                   | Verifies your entries.                                                                                                                                                                                                        |
| Step 20 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file.                                                                                                                                                                      |

## Configuring IS-IS Interface Parameters

### Procedure

|        | Command or Action                                                                                                    | Purpose                                                                                                                                                                                                                 |
|--------|----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                           | Enters the global configuration mode.                                                                                                                                                                                   |
| Step 2 | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# interface gigabitethernet 1/0/1           | Specifies the interface to be configured and enter interface configuration mode. If the interface is not already configured as a Layer 3 interface, enter the <b>no switchport</b> command to put it into Layer 3 mode. |
| Step 3 | <b>isis metric <i>default-metric</i> [level-1   level-2]</b><br><b>Example:</b><br>Device(config-if)# isis metric 15 | (Optional) Configures the metric (or cost) for the specified interface. The range is from 0 to 63. The default is 10. If no level is entered, the default is to apply to both Level 1 and Level 2 routers.              |
| Step 4 | <b>isis hello-interval {seconds   minimal} [level-1   level-2]</b><br><b>Example:</b>                                | (Optional) Specifies the length of time between hello packets sent by the switch. By default, a value three times the hello interval <i>seconds</i> is advertised as the <i>holdtime</i> in                             |

|                | Command or Action                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <pre>Device(config-if)# isis hello-interval minimal</pre>                                                                                                       | <p>the hello packets sent. With smaller hello intervals, topological changes are detected faster, but there is more routing traffic.</p> <ul style="list-style-type: none"> <li>• <b>minimal</b>—causes the system to compute the hello interval based on the hello multiplier so that the resulting hold time is 1 second.</li> <li>• <i>seconds</i>—the range is from 1 to 65535. The default is 10 seconds.</li> </ul>                                     |
| <b>Step 5</b>  | <p><b>isis hello-multiplier</b> <i>multiplier</i> [level-1   level-2]</p> <p><b>Example:</b></p> <pre>Device(config-if)# isis hello-multiplier 5</pre>          | <p>(Optional) Specifies the number of IS-IS hello packets a neighbor must miss before the router should declare the adjacency as down. The range is from 3 to 1000. The default is 3. Using a smaller hello-multiplier causes fast convergence, but can result in more routing instability.</p>                                                                                                                                                               |
| <b>Step 6</b>  | <p><b>isis csnp-interval</b> <i>seconds</i> [level-1   level-2]</p> <p><b>Example:</b></p> <pre>Device(config-if)# isis csnp-interval 15</pre>                  | <p>(Optional) Configures the IS-IS complete sequence number PDU (CSNP) interval for the interface. The range is from 0 to 65535. The default is 10 seconds.</p>                                                                                                                                                                                                                                                                                               |
| <b>Step 7</b>  | <p><b>isis retransmit-interval</b> <i>seconds</i></p> <p><b>Example:</b></p> <pre>Device(config-if)# isis retransmit-interval 7</pre>                           | <p>(Optional) Configures the number of seconds between retransmission of IS-IS LSPs for point-to-point links. The value you specify should be an integer greater than the expected round-trip delay between any two routers on the network. The range is from 0 to 65535. The default is 5 seconds.</p>                                                                                                                                                       |
| <b>Step 8</b>  | <p><b>isis retransmit-throttle-interval</b> <i>milliseconds</i></p> <p><b>Example:</b></p> <pre>Device(config-if)# isis retransmit-throttle-interval 4000</pre> | <p>(Optional) Configures the IS-IS LSP retransmission throttle interval, which is the maximum rate (number of milliseconds between packets) at which IS-IS LSPs will be re-sent on point-to-point links. The range is from 0 to 65535. The default is determined by the <b>isis lsp-interval</b> command.</p>                                                                                                                                                 |
| <b>Step 9</b>  | <p><b>isis priority</b> <i>value</i> [level-1   level-2]</p> <p><b>Example:</b></p> <pre>Device(config-if)# isis priority 50</pre>                              | <p>(Optional) Configures the priority to use for designated router election. The range is from 0 to 127. The default is 64.</p>                                                                                                                                                                                                                                                                                                                               |
| <b>Step 10</b> | <p><b>isis circuit-type</b> {level-1   level-1-2   level-2-only}</p> <p><b>Example:</b></p> <pre>Device(config-if)# isis circuit-type level-1-2</pre>           | <p>(Optional) Configures the type of adjacency desired for neighbors on the specified interface (specify the interface circuit type).</p> <ul style="list-style-type: none"> <li>• <b>level-1</b>—a Level 1 adjacency is established if there is at least one area address common to both this node and its neighbors.</li> <li>• <b>level-1-2</b>—a Level 1 and 2 adjacency is established if the neighbor is also configured as both Level 1 and</li> </ul> |

|                | Command or Action                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                          |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                                                   | <p>Level 2 and there is at least one area in common. If there is no area in common, a Level 2 adjacency is established. This is the default.</p> <ul style="list-style-type: none"> <li>• <b>level 2</b>—a Level 2 adjacency is established. If the neighbor router is a Level 1 router, no adjacency is established.</li> </ul> |
| <b>Step 11</b> | <b>isis password</b> <i>password</i> [ <b>level-1</b>   <b>level-2</b> ]<br><b>Example:</b><br><pre>Device(config-if)# isis password secret</pre> | (Optional) Configures the authentication password for an interface. By default, authentication is disabled. Specifying Level 1 or Level 2 enables the password only for Level 1 or Level 2 routing, respectively. If you do not specify a level, the default is Level 1 and Level 2.                                             |
| <b>Step 12</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                                                   | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                 |
| <b>Step 13</b> | <b>show clns interface</b> <i>interface-id</i><br><b>Example:</b><br><pre>Device# show clns interface gigabitethernet 1/0/1</pre>                 | Verifies your entries.                                                                                                                                                                                                                                                                                                           |
| <b>Step 14</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre>                             | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                         |

## Monitoring and Maintaining ISO IGRP and IS-IS

You can remove all contents of a CLNS cache or remove information for a particular neighbor or route. You can display specific CLNS or IS-IS statistics, such as the contents of routing tables, caches, and databases. You can also display information about specific interfaces, filters, or neighbors.

The following table lists the privileged EXEC commands for clearing and displaying ISO CLNS and IS-IS routing. For explanations of the display fields, see the *Cisco IOS Apollo Domain, Banyan VINES, DECnet, ISO CLNS and XNS Command Reference*, use the Cisco IOS command reference master index, or search online.

**Table 114: ISO CLNS and IS-IS Clear and Show Commands**

| Command                 | Purpose                                          |
|-------------------------|--------------------------------------------------|
| <b>clear clns cache</b> | Clears and reinitializes the CLNS routing cache. |

| Command                                          | Purpose                                                                                           |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------|
| <b>clear clns es-neighbors</b>                   | Removes end system (ES) neighbor information from the adjacency database.                         |
| <b>clear clns is-neighbors</b>                   | Removes intermediate system (IS) neighbor information from the adjacency database.                |
| <b>clear clns neighbors</b>                      | Removes CLNS neighbor information from the adjacency database.                                    |
| <b>clear clns route</b>                          | Removes dynamically derived CLNS routing information.                                             |
| <b>show clns</b>                                 | Displays information about the CLNS network.                                                      |
| <b>show clns cache</b>                           | Displays the entries in the CLNS routing cache.                                                   |
| <b>show clns es-neighbors</b>                    | Displays ES neighbor entries, including the associated areas.                                     |
| <b>show clns filter-expr</b>                     | Displays filter expressions.                                                                      |
| <b>show clns filter-set</b>                      | Displays filter sets.                                                                             |
| <b>show clns interface</b> <i>[interface-id]</i> | Displays the CLNS-specific or ES-IS information about each interface.                             |
| <b>show clns neighbor</b>                        | Displays information about IS-IS neighbors.                                                       |
| <b>show clns protocol</b>                        | List the protocol-specific information for each IS-IS or ISO IGRP routing process in this router. |
| <b>show clns route</b>                           | Displays all the destinations to which this router knows how to route CLNS packets.               |
| <b>show clns traffic</b>                         | Displays information about the CLNS packets this router has seen.                                 |
| <b>show ip route isis</b>                        | Displays the current state of the ISIS IP routing table.                                          |
| <b>show isis database</b>                        | Displays the IS-IS link-state database.                                                           |
| <b>show isis routes</b>                          | Displays the IS-IS Level 1 routing table.                                                         |
| <b>show isis spf-log</b>                         | Displays a history of the shortest path first (SPF) calculations for IS-IS.                       |
| <b>show isis topology</b>                        | Displays a list of all connected routers in all areas.                                            |
| <b>show route-map</b>                            | Displays all route maps configured or only the one specified.                                     |
| <b>trace clns</b> <i>destination</i>             | Discover the paths taken to a specified destination by packets in the network.                    |

| Command                                              | Purpose                                                                      |
|------------------------------------------------------|------------------------------------------------------------------------------|
| <b>which-route</b> <i>{nsap-address   clns-name}</i> | Displays the routing table in which the specified CLNS destination is found. |

## Configuration Examples for ISO CLNS Routing

### Example: Configuring IS-IS Routing

This example shows how to configure three routers to run conventional IS-IS as an IP routing protocol. In conventional IS-IS, all routers act as Level 1 and Level 2 routers (by default).

Router A:

```
Device(config)# clns routing
Device(config)# router isis
Device(config-router)# net 49.0001.0000.0000.000a.00
Device(config-router)# exit
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip router isis
Device(config-if)# clns router isis
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip router isis
Device(config-if)# clns router isis
Device(config-router)# exit
```

Router B:

```
Device(config)# clns routing
Device(config)# router isis
Device(config-router)# net 49.0001.0000.0000.000b.00
Device(config-router)# exit
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip router isis
Device(config-if)# clns router isis
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip router isis
Device(config-if)# clns router isis
Device(config-router)# exit
```

Router C:

```
Device(config)# clns routing
Device(config)# router isis
Device(config-router)# net 49.0001.0000.0000.000c.00
Device(config-router)# exit
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip router isis
Device(config-if)# clns router isis
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip router isis

Device(config-router)# exit
```

## Information About Multi-VRF CE

Virtual Private Networks (VPNs) provide a secure way for customers to share bandwidth over an ISP backbone network. A VPN is a collection of sites sharing a common routing table. A customer site is connected to the service-provider network by one or more interfaces, and the service provider associates each interface with a VPN routing table, called a VPN routing/forwarding (VRF) table.

The switch supports multiple VPN routing/forwarding (multi-VRF) instances in customer edge (CE) devices (multi-VRF CE) when the it is running the IP services or advanced IP Services feature set. Multi-VRF CE allows a service provider to support two or more VPNs with overlapping IP addresses.

---

**Note** The switch does not use Multiprotocol Label Switching (MPLS) to support VPNs.

---

## Understanding Multi-VRF CE

Multi-VRF CE is a feature that allows a service provider to support two or more VPNs, where IP addresses can be overlapped among the VPNs. Multi-VRF CE uses input interfaces to distinguish routes for different VPNs and forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF. Interfaces in a VRF can be either physical, such as Ethernet ports, or logical, such as VLAN SVIs, but an interface cannot belong to more than one VRF at any time.

---

**Note** Multi-VRF CE interfaces must be Layer 3 interfaces.

---

Multi-VRF CE includes these devices:

- Customer edge (CE) devices provide customers access to the service-provider network over a data link to one or more provider edge routers. The CE device advertises the site's local routes to the router and learns the remote VPN routes from it. A switch can be a CE.
- Provider edge (PE) routers exchange routing information with CE devices by using static routing or a routing protocol such as BGP, RIPv2, OSPF, or EIGRP. The PE is only required to maintain VPN routes for those VPNs to which it is directly attached, eliminating the need for the PE to maintain all of the service-provider VPN routes. Each PE router maintains a VRF for each of its directly connected sites. Multiple interfaces on a PE router can be associated with a single VRF if all of these sites participate in the same VPN. Each VPN is mapped to a specified VRF. After learning local VPN routes from CEs, a PE router exchanges VPN routing information with other PE routers by using internal BGP (IBPG).
- Provider routers or core routers are any routers in the service provider network that do not attach to CE devices.

With multi-VRF CE, multiple customers can share one CE, and only one physical link is used between the CE and the PE. The shared CE maintains separate VRF tables for each customer and switches or routes packets for each customer based on its own routing table. Multi-VRF CE extends limited PE functionality to a CE device, giving it the ability to maintain separate VRF tables to extend the privacy and security of a VPN to the branch office.

## Network Topology

The figure shows a configuration using switches as multiple virtual CEs. This scenario is suited for customers who have low bandwidth requirements for their VPN service, for example, small companies. In this case, multi-VRF CE support is required in the switches. Because multi-VRF CE is a Layer 3 feature, each interface in a VRF must be a Layer 3 interface.

**Figure 88: Switches Acting as Multiple Virtual CEs**

When the CE switch receives a command to add a Layer 3 interface to a VRF, it sets up the appropriate mapping between the VLAN ID and the policy label (PL) in multi-VRF-CE-related data structures and adds the VLAN ID and PL to the VLAN database.

When multi-VRF CE is configured, the Layer 3 forwarding table is conceptually partitioned into two sections:

- The multi-VRF CE routing section contains the routes from different VPNs.
- The global routing section contains routes to non-VPN networks, such as the Internet.

VLAN IDs from different VRFs are mapped into different policy labels, which are used to distinguish the VRFs during processing. For each new VPN route learned, the Layer 3 setup function retrieves the policy label by using the VLAN ID of the ingress port and inserts the policy label and new route to the multi-VRF CE routing section. If the packet is received from a routed port, the port internal VLAN ID number is used; if the packet is received from an SVI, the VLAN number is used.

## Packet-Forwarding Process

This is the packet-forwarding process in a multi-VRF-CE-enabled network:

- When the switch receives a packet from a VPN, the switch looks up the routing table based on the input policy label number. When a route is found, the switch forwards the packet to the PE.
- When the ingress PE receives a packet from the CE, it performs a VRF lookup. When a route is found, the router adds a corresponding MPLS label to the packet and sends it to the MPLS network.
- When an egress PE receives a packet from the network, it strips the label and uses the label to identify the correct VPN routing table. Then it performs the normal route lookup. When a route is found, it forwards the packet to the correct adjacency.
- When a CE receives a packet from an egress PE, it uses the input policy label to look up the correct VPN routing table. If a route is found, it forwards the packet within the VPN.

## Network Components

To configure VRF, you create a VRF table and specify the Layer 3 interface associated with the VRF. Then configure the routing protocols in the VPN and between the CE and the PE. BGP is the preferred routing protocol used to distribute VPN routing information across the provider's backbone. The multi-VRF CE network has three major components:

- VPN route target communities—lists of all other members of a VPN community. You need to configure VPN route targets for each VPN community member.
- Multiprotocol BGP peering of VPN community PE routers—propagates VRF reachability information to all members of a VPN community. You need to configure BGP peering in all PE routers within a VPN community.
- VPN forwarding—transports all traffic between all VPN community members across a VPN service-provider network.

## VRF-Aware Services

IP services can be configured on global interfaces, and these services run within the global routing instance. IP services are enhanced to run on multiple routing instances; they are VRF-aware. Any configured VRF in the system can be specified for a VRF-aware service.

VRF-Aware services are implemented in platform-independent modules. VRF means multiple routing instances in Cisco IOS. Each platform has its own limit on the number of VRFs it supports.

VRF-aware services have the following characteristics:

- The user can ping a host in a user-specified VRF.
- ARP entries are learned in separate VRFs. The user can display Address Resolution Protocol (ARP) entries for specific VRFs.

# How to Configure Multi-VRF CE

## Default Multi-VRF CE Configuration

*Table 115: Default VRF Configuration*

| Feature            | Default Setting                                                |
|--------------------|----------------------------------------------------------------|
| VRF                | Disabled. No VRFs are defined.                                 |
| Maps               | No import maps, export maps, or route maps are defined.        |
| VRF maximum routes | Fast Ethernet switches: 8000 Gigabit Ethernet switches: 12000. |
| Forwarding table   | The default for an interface is the global routing table.      |

## Multi-VRF CE Configuration Guidelines

**Note**

To use multi-VRF CE, you must have the IP services or advanced IP services feature set enabled on your switch.

- A switch with multi-VRF CE is shared by multiple customers, and each customer has its own routing table.
- Because customers use different VRF tables, the same IP addresses can be reused. Overlapped IP addresses are allowed in different VPNs.
- Multi-VRF CE lets multiple customers share the same physical link between the PE and the CE. Trunk ports with multiple VLANs separate packets among customers. Each customer has its own VLAN.
- Multi-VRF CE does not support all MPLS-VRF functionality. It does not support label exchange, LDP adjacency, or labeled packets.
- For the PE router, there is no difference between using multi-VRF CE or using multiple CEs. In Figure 41-6, multiple virtual Layer 3 interfaces are connected to the multi-VRF CE device.
- The switch supports configuring VRF by using physical ports, VLAN SVIs, or a combination of both. The SVIs can be connected through an access port or a trunk port.
- A customer can use multiple VLANs as long as they do not overlap with those of other customers. A customer's VLANs are mapped to a specific routing table ID that is used to identify the appropriate routing tables stored on the switch.
- Most routing protocols (BGP, OSPF, RIP, and static routing) can be used between the CE and the PE. However, we recommend using external BGP (EBGP) for these reasons:
  - BGP does not require multiple algorithms to communicate with multiple CEs.
  - BGP is designed for passing routing information between systems run by different administrations.
  - BGP makes it easy to pass attributes of the routes to the CE.
- Multi-VRF CE does not affect the packet switching rate.
- VPN multicast is not supported.
- You can enable VRF on a private VLAN, and the reverse.
- You cannot enable VRF when policy-based routing (PBR) is enabled on an interface, and the reverse.
- You cannot enable VRF when Web Cache Communication Protocol (WCCP) is enabled on an interface, and the reverse.

## Configuring VRFs

For complete syntax and usage information for the commands, see the switch command reference for this release and the *Cisco IOS Switching Services Command Reference*.

## Procedure

|               | Command or Action                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                                                          | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                       |
| <b>Step 2</b> | <b>ip routing</b><br><b>Example:</b><br><br>Device(config)# <b>ip routing</b>                                                                                  | Enables IP routing.                                                                                                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>ip vrf vrf-name</b><br><b>Example:</b><br><br>Device(config)# <b>ip vrf vpn1</b>                                                                            | Names the VRF, and enter VRF configuration mode.                                                                                                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>rd route-distinguisher</b><br><b>Example:</b><br><br>Device(config-vrf)# <b>rd 100:2</b>                                                                    | Creates a VRF table by specifying a route distinguisher. Enter either an AS number and an arbitrary number (xxx:y) or an IP address and arbitrary number (A.B.C.D:y)                                                                                                                                                                        |
| <b>Step 5</b> | <b>route-target {export   import   both}</b><br><i>route-target-ext-community</i><br><b>Example:</b><br><br>Device(config-vrf)# <b>route-target both 100:2</b> | Creates a list of import, export, or import and export route target communities for the specified VRF. Enter either an AS system number and an arbitrary number (xxx:y) or an IP address and an arbitrary number (A.B.C.D:y). The <i>route-target-ext-community</i> should be the same as the <i>route-distinguisher</i> entered in Step 4. |
| <b>Step 6</b> | <b>import map route-map</b><br><b>Example:</b><br><br>Device(config-vrf)# <b>import map importmap1</b>                                                         | (Optional) Associates a route map with the VRF.                                                                                                                                                                                                                                                                                             |
| <b>Step 7</b> | <b>interface interface-id</b><br><b>Example:</b><br><br>Device(config-vrf)# <b>interface gigabitethernet 1/0/1</b>                                             | Specifies the Layer 3 interface to be associated with the VRF, and enter interface configuration mode. The interface can be a routed port or SVI.                                                                                                                                                                                           |
| <b>Step 8</b> | <b>ip vrf forwarding vrf-name</b><br><b>Example:</b><br><br>Device(config-if)# <b>ip vrf forwarding vpn1</b>                                                   | Associates the VRF with the Layer 3 interface.                                                                                                                                                                                                                                                                                              |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b>                                                                                                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                            |

|                | Command or Action                                                                                                     | Purpose                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|
|                | Device(config)# <b>end</b>                                                                                            |                                                                             |
| <b>Step 10</b> | <b>show ip vrf [brief   detail   interfaces] [vrf-name]</b><br><b>Example:</b><br>Device# show ip vrf interfaces vpn1 | Verifies the configuration. Displays information about the configured VRFs. |
| <b>Step 11</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>     | (Optional) Saves your entries in the configuration file.                    |

## Configuring VRF-Aware Services

These services are VRF-Aware:

- ARP
- Ping
- Simple Network Management Protocol (SNMP)
- Unicast Reverse Path Forwarding (uRPF)
- Syslog
- Traceroute
- FTP and TFTP

**Note** The switch does not support VRF-aware services for Unicast Reverse Path Forwarding (uRPF) or Network Time Protocol (NTP).

## Configuring VRF-Aware Services for ARP

For complete syntax and usage information for the commands, see the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.4*.

### Procedure

|               | Command or Action                                                                  | Purpose                                      |
|---------------|------------------------------------------------------------------------------------|----------------------------------------------|
| <b>Step 1</b> | <b>show ip arp vrf vrf-name</b><br><b>Example:</b><br>Device# show ip arp vrf vpn1 | Displays the ARP table in the specified VRF. |

## Configuring VRF-Aware Services for Ping

For complete syntax and usage information for the commands, see the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.4*.

### Procedure

|               | Command or Action                                                                                                   | Purpose                                      |
|---------------|---------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| <b>Step 1</b> | <p><b>ping vrf</b><i>vrf-name</i><b>ip-host</b></p> <p><b>Example:</b></p> <pre>Device# ping vrf vpn1 ip-host</pre> | Displays the ARP table in the specified VRF. |

## Configuring VRF-Aware Services for SNMP

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.4*.

### Procedure

|               | Command or Action                                                                                                                                                                                                   | Purpose                                                                                                          |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                                                       | Enters the global configuration mode.                                                                            |
| <b>Step 2</b> | <p><b>snmp-server trap authentication vrf</b></p> <p><b>Example:</b></p> <pre>Device(config)# snmp-server trap authentication vrf</pre>                                                                             | Enables SNMP traps for packets on a VRF.                                                                         |
| <b>Step 3</b> | <p><b>snmp-server engineID remote</b> <i>host vrf vpn-instance engine-id string</i></p> <p><b>Example:</b></p> <pre>Device(config)# snmp-server engineID remote 172.16.20.3 vrf vpn1 80000009030000B064EFE100</pre> | Configures a name for the remote SNMP engine on a switch.                                                        |
| <b>Step 4</b> | <p><b>snmp-server host</b> <i>host vrf vpn-instance traps community</i></p> <p><b>Example:</b></p> <pre>Device(config)# snmp-server host 172.16.20.3 vrf vpn1 traps comaccess</pre>                                 | Specifies the recipient of an SNMP trap operation and specifies the VRF table to be used for sending SNMP traps. |

|        | Command or Action                                                                                                                                                                                                 | Purpose                                                                                                              |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Step 5 | <b>snmp-server host</b> <i>host vrf vpn-instance informs community</i><br><b>Example:</b><br><pre>Device(config)# snmp-server host 172.16.20.3 vrf vpn1 informs comaccess</pre>                                   | Specifies the recipient of an SNMP inform operation and specifies the VRF table to be used for sending SNMP informs. |
| Step 6 | <b>snmp-server user</b> <i>user group remote host vrf vpn-instance security model</i><br><b>Example:</b><br><pre>Device(config)# snmp-server user abcd remote 172.16.20.3 vrf vpn1 priv v2c 3des secure3des</pre> | Adds a user to an SNMP group for a remote host on a VRF for SNMP access.                                             |
| Step 7 | <b>end</b><br><b>Example:</b><br><pre>Device(config-if)# end</pre>                                                                                                                                                | Returns to privileged EXEC mode.                                                                                     |

## Configuring VRF-Aware Services for uRPF

uRPF can be configured on an interface assigned to a VRF, and source lookup is done in the VRF table.

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.4*.

### Procedure

|        | Command or Action                                                                                                     | Purpose                                                                                |
|--------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                 | Enters the global configuration mode.                                                  |
| Step 2 | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br><pre>Device(config)# interface gigabitethernet 1/0/1</pre> | Enters interface configuration mode, and specifies the Layer 3 interface to configure. |
| Step 3 | <b>no switchport</b><br><b>Example:</b><br><pre>Device(config-if)# no switchport</pre>                                | Removes the interface from Layer 2 configuration mode if it is a physical interface.   |
| Step 4 | <b>ip vrf forwarding</b> <i>vrf-name</i><br><b>Example:</b>                                                           | Configures VRF on the interface.                                                       |

|               | Command or Action                                                                                             | Purpose                                  |
|---------------|---------------------------------------------------------------------------------------------------------------|------------------------------------------|
|               | Device(config-if)# ip vrf forwarding vpn2                                                                     |                                          |
| <b>Step 5</b> | <b>ip address</b> <i>ip-address</i><br><b>Example:</b><br>Device(config-if)# ip address 10.1.5.1              | Enters the IP address for the interface. |
| <b>Step 6</b> | <b>ip verify unicast reverse-path</b><br><b>Example:</b><br>Device(config-if)# ip verify unicast reverse-path | Enables uRPF on the interface.           |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                | Returns to privileged EXEC mode.         |

## Configuring VRF-Aware RADIUS

To configure VRF-Aware RADIUS, you must first enable AAA on a RADIUS server. The switch supports the **ip vrf forwarding** *vrf-name* server-group configuration and the **ip radius source-interface** global configuration commands, as described in the Per VRF AAA Feature Guide.

## Configuring VRF-Aware Services for Syslog

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.4*.

### Procedure

|               | Command or Action                                                                                                                      | Purpose                                                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                      | Enters the global configuration mode.                                                  |
| <b>Step 2</b> | <b>logging on</b><br><b>Example:</b><br>Device(config)# logging on                                                                     | Enables or temporarily disables logging of storage router event message.               |
| <b>Step 3</b> | <b>logging host</b> <i>ip-address</i> <b>vrf</b> <i>vrf-name</i><br><b>Example:</b><br>Device(config)# logging host 10.10.1.0 vrf vpn1 | Specifies the host address of the syslog server where logging messages are to be sent. |

|               | Command or Action                                                                                                                                        | Purpose                                                |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <b>Step 4</b> | <b>logging buffered <i>logging buffered size</i> debugging</b><br><b>Example:</b><br><pre>Device(config)# logging buffered critical 6000 debugging</pre> | Logs messages to an internal buffer.                   |
| <b>Step 5</b> | <b>logging trap debugging</b><br><b>Example:</b><br><pre>Device(config)# logging trap debugging</pre>                                                    | Limits the logging messages sent to the syslog server. |
| <b>Step 6</b> | <b>logging facility <i>facility</i></b><br><b>Example:</b><br><pre>Device(config)# logging facility user</pre>                                           | Sends system logging messages to a logging facility.   |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config-if)# end</pre>                                                                                       | Returns to privileged EXEC mode.                       |

## Configuring VRF-Aware Services for Traceroute

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the Cisco IOS Switching Services Command Reference, Release 12.4.

### Procedure

|               | Command or Action                                                                                                              | Purpose                                                                   |
|---------------|--------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| <b>Step 1</b> | <b>traceroute vrf <i>vrf-name ipaddress</i></b><br><b>Example:</b><br><pre>Device(config)# traceroute vrf vpn2 10.10.1.1</pre> | Specifies the name of a VPN VRF in which to find the destination address. |

## Configuring VRF-Aware Services for FTP and TFTP

So that FTP and TFTP are VRF-aware, you must configure some FTP/TFTP CLIs. For example, if you want to use a VRF table that is attached to an interface, say E1/0, you need to configure the `ip tftp source-interface E1/0` or the `ip ftp source-interface E1/0` command to inform TFTP or FTP server to use a specific routing table. In this example, the VRF table is used to look up the destination IP address. These changes are backward-compatible and do not affect existing behavior. That is, you can use the source-interface CLI to send packets out a particular interface even if no VRF is configured on that interface.

## Procedure

|               | Command or Action                                                                                                                                                        | Purpose                                               |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                  | Enters the global configuration mode.                 |
| <b>Step 2</b> | <b>ip ftp source-interface <i>interface-type interface-number</i></b><br><b>Example:</b><br>Device(config)# <code>ip ftp source-interface gigabitethernet 1/0/2</code>   | Specifies the source IP address for FTP connections.  |
| <b>Step 3</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                        | Returns to privileged EXEC mode.                      |
| <b>Step 4</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                  | Enters global configuration mode.                     |
| <b>Step 5</b> | <b>ip tftp source-interface <i>interface-type interface-number</i></b><br><b>Example:</b><br>Device(config)# <code>ip tftp source-interface gigabitethernet 1/0/2</code> | Specifies the source IP address for TFTP connections. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                        | Returns to privileged EXEC mode.                      |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                                                                        | Returns to privileged EXEC mode.                      |

## Configuring Multicast VRFs

For complete syntax and usage information for the commands, see the switch command reference for this release and the *Cisco IOS IP Multicast Command Reference*.

For more information about configuring a multicast within a Multi-VRF CE, see the *IP Routing: Protocol-Independent Configuration Guide, Cisco IOS Release 15S*.

## Procedure

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                     | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                       |
| <b>Step 2</b> | <b>ip routing</b><br><b>Example:</b><br>Device(config)# ip routing                                                                                    | Enables IP routing mode.                                                                                                                                                                                                                                                                                                                    |
| <b>Step 3</b> | <b>ip vrf vrf-name</b><br><b>Example:</b><br>Device(config)# ip vrf vpn1                                                                              | Names the VRF, and enter VRF configuration mode.                                                                                                                                                                                                                                                                                            |
| <b>Step 4</b> | <b>rd route-distinguisher</b><br><b>Example:</b><br>Device(config-vrf)# rd 100:2                                                                      | Creates a VRF table by specifying a route distinguisher. Enter either an AS number and an arbitrary number (xxx:y) or an IP address and an arbitrary number (A.B.C.D:y)                                                                                                                                                                     |
| <b>Step 5</b> | <b>route-target {export   import   both}</b><br><b>route-target-ext-community</b><br><b>Example:</b><br>Device(config-vrf)# route-target import 100:2 | Creates a list of import, export, or import and export route target communities for the specified VRF. Enter either an AS system number and an arbitrary number (xxx:y) or an IP address and an arbitrary number (A.B.C.D:y). The <i>route-target-ext-community</i> should be the same as the <i>route-distinguisher</i> entered in Step 4. |
| <b>Step 6</b> | <b>import map route-map</b><br><b>Example:</b><br>Device(config-vrf)# import map importmap1                                                           | (Optional) Associates a route map with the VRF.                                                                                                                                                                                                                                                                                             |
| <b>Step 7</b> | <b>ip multicast-routing vrf vrf-name distributed</b><br><b>Example:</b><br>Device(config-vrf)# ip multicast-routing vrf vpn1 distributed              | (Optional) Enables global multicast routing for VRF table.                                                                                                                                                                                                                                                                                  |
| <b>Step 8</b> | <b>interface interface-id</b><br><b>Example:</b><br>Device(config-vrf)# interface gigabitethernet 1/0/2                                               | Specifies the Layer 3 interface to be associated with the VRF, and enter interface configuration mode. The interface can be a routed port or an SVI.                                                                                                                                                                                        |
| <b>Step 9</b> | <b>ip vrf forwarding vrf-name</b><br><b>Example:</b>                                                                                                  | Associates the VRF with the Layer 3 interface.                                                                                                                                                                                                                                                                                              |

|                | Command or Action                                                                                                        | Purpose                                                                     |
|----------------|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|
|                | Device(config-if)# ip vrf forwarding vpn1                                                                                |                                                                             |
| <b>Step 10</b> | <b>ip address <i>ip-address</i> mask</b><br><b>Example:</b><br>Device(config-if)# ip address 10.1.5.1<br>255.255.255.0   | Configures IP address for the Layer 3 interface.                            |
| <b>Step 11</b> | <b>ip pim sparse-dense mode</b><br><b>Example:</b><br>Device(config-if)# ip pim sparse-dense mode                        | Enables PIM on the VRF-associated Layer 3 interface.                        |
| <b>Step 12</b> | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                                     | Returns to privileged EXEC mode.                                            |
| <b>Step 13</b> | <b>show ip vrf [brief   detail   interfaces] [<i>vrf-name</i>]</b><br><b>Example:</b><br>Device# show ip vrf detail vpn1 | Verifies the configuration. Displays information about the configured VRFs. |
| <b>Step 14</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config               | (Optional) Saves your entries in the configuration file.                    |

## Configuring a VPN Routing Session

Routing within the VPN can be configured with any supported routing protocol (RIP, OSPF, EIGRP, or BGP) or with static routing. The configuration shown here is for OSPF, but the process is the same for other protocols.

**Note** To configure an EIGRP routing process to run within a VRF instance, you must configure an autonomous-system number by entering the **autonomous-system** *autonomous-system-number* address-family configuration mode command.

### Procedure

|               | Command or Action                            | Purpose                           |
|---------------|----------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b> | Enters global configuration mode. |

|               | Command or Action                                                                                                                               | Purpose                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
|               | Device# configure terminal                                                                                                                      |                                                                                                 |
| <b>Step 2</b> | <b>router ospf</b> <i>process-id</i> <b>vrf</b> <i>vrf-name</i><br><b>Example:</b><br>Device(config)# router ospf 1 vrf vpn1                    | Enables OSPF routing, specifies a VPN forwarding table, and enter router configuration mode.    |
| <b>Step 3</b> | <b>log-adjacency-changes</b><br><b>Example:</b><br>Device(config-router)# log-adjacency-changes                                                 | (Optional) Logs changes in the adjacency state. This is the default state.                      |
| <b>Step 4</b> | <b>redistribute bgp</b> <i>autonomous-system-number</i> <b>subnets</b><br><b>Example:</b><br>Device(config-router)# redistribute bgp 10 subnets | Sets the switch to redistribute information from the BGP network to the OSPF network.           |
| <b>Step 5</b> | <b>network</b> <i>network-number</i> <b>area</b> <i>area-id</i><br><b>Example:</b><br>Device(config-router)# network 1 area 2                   | Defines a network address and mask on which OSPF runs and the area ID for that network address. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config-router)# end                                                                                     | Returns to privileged EXEC mode.                                                                |
| <b>Step 7</b> | <b>show ip ospf</b> <i>process-id</i><br><b>Example:</b><br>Device# show ip ospf 1                                                              | Verifies the configuration of the OSPF network.                                                 |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config                                      | (Optional) Saves your entries in the configuration file.                                        |

## Configuring BGP PE to CE Routing Sessions

### Procedure

|               | Command or Action                            | Purpose                           |
|---------------|----------------------------------------------|-----------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b> | Enters global configuration mode. |

|               | Command or Action                                                                                                                                | Purpose                                                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
|               | Device# configure terminal                                                                                                                       |                                                                                                                         |
| <b>Step 2</b> | <b>router bgp</b> <i>autonomous-system-number</i><br><b>Example:</b><br>Device(config)# router bgp 2                                             | Configures the BGP routing process with the AS number passed to other BGP routers, and enter router configuration mode. |
| <b>Step 3</b> | <b>network</b> <i>network-number</i> <b>mask</b> <i>network-mask</i><br><b>Example:</b><br>Device(config-router)# network 5 mask 255.255.255.0   | Specifies a network and mask to announce using BGP.                                                                     |
| <b>Step 4</b> | <b>redistribute ospf</b> <i>process-id</i> <b>match internal</b><br><b>Example:</b><br>Device(config-router)# redistribute ospf 1 match internal | Sets the switch to redistribute OSPF internal routes.                                                                   |
| <b>Step 5</b> | <b>network</b> <i>network-number</i> <b>area</b> <i>area-id</i><br><b>Example:</b><br>Device(config-router)# network 5 area 2                    | Defines a network address and mask on which OSPF runs and the area ID for that network address.                         |
| <b>Step 6</b> | <b>address-family ipv4 vrf</b> <i>vrf-name</i><br><b>Example:</b><br>Device(config-router)# address-family ipv4 vrf vpn1                         | Defines BGP parameters for PE to CE routing sessions, and enter VRF address-family mode.                                |
| <b>Step 7</b> | <b>neighbor</b> <i>address</i> <b>remote-as</b> <i>as-number</i><br><b>Example:</b><br>Device(config-router)# neighbor 10.1.1.2 remote-as 2      | Defines a BGP session between PE and CE routers.                                                                        |
| <b>Step 8</b> | <b>neighbor</b> <i>address</i> <b>activate</b><br><b>Example:</b><br>Device(config-router)# neighbor 10.2.1.1 activate                           | Activates the advertisement of the IPv4 address family.                                                                 |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Device(config-router)# end                                                                                      | Returns to privileged EXEC mode.                                                                                        |

|         | Command or Action                                                                                          | Purpose                                                  |
|---------|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 10 | <b>show ip bgp [ipv4] [neighbors]</b><br><b>Example:</b><br>Device# show ip bgp ipv4 neighbors             | Verifies BGP configuration.                              |
| Step 11 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

## Monitoring Multi-VRF CE

Table 116: Commands for Displaying Multi-VRF CE Information

|                                                                                                                                                                                                                                          |                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| <b>show ip protocols vrf</b> <i>vrf-name</i>                                                                                                                                                                                             | Displays routing protocol information associated with a VRF. |
| <b>show ip route vrf</b> <i>vrf-name</i> [ <b>connected</b> ] [ <i>protocol</i> [ <i>as-number</i> ]] [ <b>list</b> ] [ <b>mobile</b> ] [ <b>odr</b> ] [ <b>profile</b> ] [ <b>static</b> ] [ <b>summary</b> ] [ <b>supernets-only</b> ] | Displays IP routing table information associated with a VRF. |
| <b>show ip vrf</b> [ <b>brief</b>   <b>detail</b>   <b>interfaces</b> ] [ <i>vrf-name</i> ]                                                                                                                                              | Displays information about the defined VRF instances.        |

For more information about the information in the displays, see the *Cisco IOS Switching Services Command Reference, Release 12.4*.

## Configuration Examples for Multi-VRF CE

### Multi-VRF CE Configuration Example

OSPF is the protocol used in VPN1, VPN2, and the global network. BGP is used in the CE to PE connections. The examples following the illustration show how to configure a switch as CE Switch A, and the VRF configuration for customer switches D and F. Commands for configuring CE Switch C and the other customer switches are not included but would be similar. The example also includes commands for configuring traffic to Switch A for a Catalyst 6000 or Catalyst 6500 switch acting as a PE router.

```

Device(config-if)# switchport mode trunk
Device(config-if)# no ip address
Device(config-if)# exit
Device(config)# interface gigabitethernet1/0/8
Device(config-if)# switchport access vlan 208
Device(config-if)# no ip address
Device(config-if)# exit
Device(config)# interface gigabitethernet1/0/11
Device(config-if)# switchport trunk encapsulation dot1q
Device(config-if)# switchport mode trunk
Device(config-if)# no ip address
Device(config-if)# exit

```

Configure the VLANs used on Switch A. VLAN 10 is used by VRF 11 between the CE and the PE. VLAN 20 is used by VRF 12 between the CE and the PE. VLANs 118 and 208 are used for the VPNs that include Switch F and Switch D, respectively:

```

Device(config)# interface vlan10
Device(config-if)# ip vrf forwarding v11
Device(config-if)# ip address 38.0.0.8 255.255.255.0
Device(config-if)# exit
Device(config)# interface vlan20
Device(config-if)# ip vrf forwarding v12
Device(config-if)# ip address 83.0.0.8 255.255.255.0
Device(config-if)# exit
Device(config)# interface vlan118
Device(config-if)# ip vrf forwarding v12
Device(config-if)# ip address 118.0.0.8 255.255.255.0
Device(config-if)# exit
Device(config)# interface vlan208
Device(config-if)# ip vrf forwarding v11
Device(config-if)# ip address 208.0.0.8 255.255.255.0
Device(config-if)# exit

```

Configure OSPF routing in VPN1 and VPN2.

```

Device(config)# router ospf 1 vrf v11
Device(config-router)# redistribute bgp 800 subnets
Device(config-router)# network 208.0.0.0 0.0.0.255 area 0
Device(config-router)# exit
Device(config)# router ospf 2 vrf v12
Device(config-router)# redistribute bgp 800 subnets
Device(config-router)# network 118.0.0.0 0.0.0.255 area 0
Device(config-router)# exit

```

Configure BGP for CE to PE routing.

```

Device(config)# router bgp 800
Device(config-router)# address-family ipv4 vrf v12
Device(config-router-af)# redistribute ospf 2 match internal
Device(config-router-af)# neighbor 83.0.0.3 remote-as 100
Device(config-router-af)# neighbor 83.0.0.3 activate
Device(config-router-af)# network 8.8.2.0 mask 255.255.255.0
Device(config-router-af)# exit
Device(config-router)# address-family ipv4 vrf v11
Device(config-router-af)# redistribute ospf 1 match internal
Device(config-router-af)# neighbor 38.0.0.3 remote-as 100
Device(config-router-af)# neighbor 38.0.0.3 activate
Device(config-router-af)# network 8.8.1.0 mask 255.255.255.0
Device(config-router-af)# end

```

Switch D belongs to VPN 1. Configure the connection to Switch A by using these commands.

```

Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ip routing
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# no switchport
Device(config-if)# ip address 208.0.0.20 255.255.255.0
Device(config-if)# exit

Device(config)# router ospf 101
Device(config-router)# network 208.0.0.0 0.0.0.255 area 0
Device(config-router)# end

```

Switch F belongs to VPN 2. Configure the connection to Switch A by using these commands.

```

Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ip routing
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# switchport trunk encapsulation dot1q
Device(config-if)# switchport mode trunk
Device(config-if)# no ip address
Device(config-if)# exit

Device(config)# interface vlan118
Device(config-if)# ip address 118.0.0.11 255.255.255.0
Device(config-if)# exit

Device(config)# router ospf 101
Device(config-router)# network 118.0.0.0 0.0.0.255 area 0
Device(config-router)# end

```

When used on switch B (the PE router), these commands configure only the connections to the CE device, Switch A.

```

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip vrf v1
Router(config-vrf)# rd 100:1
Router(config-vrf)# route-target export 100:1
Router(config-vrf)# route-target import 100:1
Router(config-vrf)# exit

Router(config)# ip vrf v2
Router(config-vrf)# rd 100:2
Router(config-vrf)# route-target export 100:2
Router(config-vrf)# route-target import 100:2
Router(config-vrf)# exit
Router(config)# ip cef
Router(config)# interface Loopback1
Router(config-if)# ip vrf forwarding v1
Router(config-if)# ip address 3.3.1.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface Loopback2
Router(config-if)# ip vrf forwarding v2
Router(config-if)# ip address 3.3.2.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface gigabitethernet1/1/0.10
Router(config-if)# encapsulation dot1q 10
Router(config-if)# ip vrf forwarding v1
Router(config-if)# ip address 38.0.0.3 255.255.255.0

```

```
Router(config-if)# exit

Router(config)# interface gigabitethernet1/1/0.20
Router(config-if)# encapsulation dot1q 20
Router(config-if)# ip vrf forwarding v2
Router(config-if)# ip address 83.0.0.3 255.255.255.0
Router(config-if)# exit

Router(config)# router bgp 100
Router(config-router)# address-family ipv4 vrf v2
Router(config-router-af)# neighbor 83.0.0.8 remote-as 800
Router(config-router-af)# neighbor 83.0.0.8 activate
Router(config-router-af)# network 3.3.2.0 mask 255.255.255.0
Router(config-router-af)# exit
Router(config-router)# address-family ipv4 vrf v1
Router(config-router-af)# neighbor 38.0.0.8 remote-as 800
Router(config-router-af)# neighbor 38.0.0.8 activate
Router(config-router-af)# network 3.3.1.0 mask 255.255.255.0
Router(config-router-af)# end
```

## Configuring Unicast Reverse Path Forwarding

The unicast reverse path forwarding (unicast RPF) feature helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. For example, a number of common types of denial-of-service (DoS) attacks, including Smurf and Tribal Flood Network (TFN), can take advantage of forged or rapidly changing source IP addresses to allow attackers to thwart efforts to locate or filter the attacks. For Internet service providers (ISPs) that provide public access, Unicast RPF deflects such attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This action protects the network of the ISP, its customer, and the rest of the Internet.

**Note**

- Unicast RPF is supported in IP Services .
- Do not configure unicast RPF if the switch is in a mixed hardware stack combining more than one switch type. For example, Catalyst 3750-X, Catalyst 3750-E, and Catalyst 3750 switches.

For detailed IP unicast RPF configuration information, see the *Other Security Features* chapter in the *Cisco IOS Security Configuration Guide*.

## Protocol-Independent Features

This section describes IP routing protocol-independent features that are available on switches running the IP Base or the IP Services feature set ;except that with the IP Base feature set, protocol-related features are available only for RIP. For a complete description of the IP routing protocol-independent commands in this chapter, see the “IP Routing Protocol-Independent Commands” chapter of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols*.

# Distributed Cisco Express Forwarding

## Information About Cisco Express Forwarding

Cisco Express Forwarding (CEF) is a Layer 3 IP switching technology used to optimize network performance. CEF implements an advanced IP look-up and forwarding algorithm to deliver maximum Layer 3 switching performance. CEF is less CPU-intensive than fast switching route caching, allowing more CPU processing power to be dedicated to packet forwarding. In a switch stack, the hardware uses distributed CEF (dCEF) in the stack. In dynamic networks, fast switching cache entries are frequently invalidated because of routing changes, which can cause traffic to be process switched using the routing table, instead of fast switched using the route cache. CEF and dCEF use the Forwarding Information Base (FIB) lookup table to perform destination-based switching of IP packets.

The two main components in CEF and dCEF are the distributed FIB and the distributed adjacency tables.

- The FIB is similar to a routing table or information base and maintains a mirror image of the forwarding information in the IP routing table. When routing or topology changes occur in the network, the IP routing table is updated, and those changes are reflected in the FIB. The FIB maintains next-hop address information based on the information in the IP routing table. Because the FIB contains all known routes that exist in the routing table, CEF eliminates route cache maintenance, is more efficient for switching traffic, and is not affected by traffic patterns.
- Nodes in the network are said to be adjacent if they can reach each other with a single hop across a link layer. CEF uses adjacency tables to prepend Layer 2 addressing information. The adjacency table maintains Layer 2 next-hop addresses for all FIB entries.

Because the switch or switch stack uses Application Specific Integrated Circuits (ASICs) to achieve Gigabit-speed line rate IP traffic, CEF or dCEF forwarding applies only to the software-forwarding path, that is, traffic that is forwarded by the CPU.

## How to Configure Cisco Express Forwarding

CEF or distributed CEF is enabled globally by default. If for some reason it is disabled, you can re-enable it by using the **ip cef** or **ip cef distributed** global configuration command.

The default configuration is CEF or dCEF enabled on all Layer 3 interfaces. Entering the **no ip route-cache cef** interface configuration command disables CEF for traffic that is being forwarded by software. This command does not affect the hardware forwarding path. Disabling CEF and using the **debug ip packet detail** privileged EXEC command can be useful to debug software-forwarded traffic. To enable CEF on an interface for the software-forwarding path, use the **ip route-cache cef** interface configuration command.

### Caution

Although the **no ip route-cache cef** interface configuration command to disable CEF on an interface is visible in the CLI, we strongly recommend that you do not disable CEF or dCEF on interfaces except for debugging purposes.

To enable CEF or dCEF globally and on an interface for software-forwarded traffic if it has been disabled:

### SUMMARY STEPS

1. **configure terminal**
2. **ip cef**

3. **ip cef distributed**
4. **interface *interface-id***
5. **ip route-cache cef**
6. **end**
7. **show ip cef**
8. **show cef linecard [detail]**
9. **show cef linecard [slot-number] [detail]**
10. **show cef interface [interface-id]**
11. **show adjacency**
12. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                       | Purpose                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                 | Enters the global configuration mode.                                                  |
| <b>Step 2</b> | <b>ip cef</b><br><b>Example:</b><br>Device(config)# <code>ip cef</code>                                                 | Enables CEF operation on a non-stacking switch.<br>Go to Step 4.                       |
| <b>Step 3</b> | <b>ip cef distributed</b><br><b>Example:</b><br>Device(config)# <code>ip cef distributed</code>                         | Enables CEF operation on a active switch.                                              |
| <b>Step 4</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet 1/0/1</code> | Enters interface configuration mode, and specifies the Layer 3 interface to configure. |
| <b>Step 5</b> | <b>ip route-cache cef</b><br><b>Example:</b><br>Device(config-if)# <code>ip route-cache cef</code>                      | Enables CEF on the interface for software-forwarded traffic.                           |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <code>end</code>                                                    | Returns to privileged EXEC mode.                                                       |
| <b>Step 7</b> | <b>show ip cef</b><br><b>Example:</b>                                                                                   | Displays the CEF status on all interfaces.                                             |

|                | Command or Action                                                                                               | Purpose                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Device# show ip cef                                                                                             |                                                                                                                                                                                                                               |
| <b>Step 8</b>  | <b>show cef linecard [detail]</b><br><b>Example:</b><br>Device# show cef linecard detail                        | (Optional) Displays CEF-related interface information on a non-stacking switch.                                                                                                                                               |
| <b>Step 9</b>  | <b>show cef linecard [slot-number] [detail]</b><br><b>Example:</b><br>Device# show cef linecard 5 detail        | (Optional) Displays CEF-related interface information on a switch by stack member for all switches in the stack or for the specified switch.<br><br>(Optional) For <i>slot-number</i> , enter the stack member switch number. |
| <b>Step 10</b> | <b>show cef interface [interface-id]</b><br><b>Example:</b><br>Device# show cef interface gigabitethernet 1/0/1 | Displays detailed CEF information for all interfaces or the specified interface.                                                                                                                                              |
| <b>Step 11</b> | <b>show adjacency</b><br><b>Example:</b><br>Device# show adjacency                                              | Displays CEF adjacency table information.                                                                                                                                                                                     |
| <b>Step 12</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config      | (Optional) Saves your entries in the configuration file.                                                                                                                                                                      |

## Load-Balancing Scheme for CEF Traffic

### Restrictions for Configuring a Load-Balancing Scheme for CEF Traffic

You must globally configure load balancing on device or device stack members in the same way: either in per-destination or per-packet mode. It is not possible to configure some packet prefixes in per-destination mode and others in per-packet mode.

### Prerequisites for Configuring a Load-Balancing Scheme for CEF Traffic

If you enable per-packet load balancing for traffic going to a particular destination, all interfaces that can forward traffic to that destination must be enabled for per-packet load balancing.

### CEF Load-Balancing Overview

CEF load balancing allows you to optimize resources by distributing traffic over multiple paths. CEF load balancing works based on a combination of source and destination packet information.

You can configure load balancing on a per-destination or per-packet basis. Because load-balancing decisions are made on the outbound interface, load balancing must be configured on the outbound interface.

## Per-Destination Load Balancing for CEF Traffic

Per-destination load balancing allows the device to use multiple paths to achieve load sharing across multiple source-destination host pairs. Packets for a given source-destination host pair are guaranteed to take the same path, even if multiple paths are available. Traffic streams destined for different pairs tend to take different paths.

Per-destination load balancing is enabled by default when you enable CEF. To use per-destination load balancing, you do not perform any additional tasks once CEF is enabled. Per-destination is the load-balancing method of choice for most situations.

Because per-destination load balancing depends on the statistical distribution of traffic, load sharing becomes more effective as the number of source-destination host pairs increases.

You can use per-destination load balancing to ensure that packets for a given host pair arrive in order. All packets intended for a certain host pair are routed over the same link (or links).

Typically, you disable per-destination load balancing when you want to enable per-packet load balancing.

## Per-Packet Load Balancing for CEF Traffic

Per-packet load balancing allows the device to send successive data packets over different paths without regard to individual hosts or user sessions. It uses the round-robin method to determine which path each packet takes to the destination. Per-packet load balancing ensures that the traffic is balanced over multiple links.

Per-packet load balancing is good for single-path destinations, but packets for a given source-destination host pair might take different paths. Per-packet load balancing can therefore introduce reordering of packets. This type of load balancing is inappropriate for certain types of data traffic (such as voice traffic over IP) that depend on packets arriving at the destination in sequence.

Use per-packet load balancing to help ensure that a path for a single source-destination host pair does not get overloaded. If the bulk of the data passing through parallel links is for a single pair, per-destination load balancing overloads a single link while other links have very little traffic. Enabling per-packet load balancing allows you to use alternate paths to the same busy destination.

## Load-Balancing Algorithms for CEF Traffic

The following load-balancing algorithms are provided for use with CEF traffic. You select a load-balancing algorithm with the **ip cef load-sharing algorithm** command.

- Original algorithm—The original load-balancing algorithm produces distortions in load sharing across multiple devices because the same algorithm was used on every device. Depending on your network environment, you should select the algorithm.
- Universal algorithm—The universal load-balancing algorithm allows each device on the network to make a different load sharing decision for each source-destination address pair, which resolves load-sharing imbalances. The device is set to perform universal load sharing by default.

## How to Configure a Load-Balancing for CEF Traffic

The following sections provide information on configuring load-balancing for CEF traffic.

## Enabling or Disabling CEF Per-Destination Load Balancing

To enable per-packet load balancing, per-destination load balancing needs to be disabled.

To enable or disable CEF per-destination load balancing, perform the following procedure:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **[no] ip cef load-sharing [per-packet] [per-destination]**
5. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                        |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device# <b>enable</b>                                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                     | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                              |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config-if)# <b>interface</b> gigabitethernet 1/0/1                                  | Enters interface configuration mode, and specifies the Layer 3 interface to configure.                                                                                                                                                                                                                                                                         |
| <b>Step 4</b> | <b>[no] ip cef load-sharing [per-packet] [per-destination]</b><br><b>Example:</b><br>Device(config-if)# <b>no ip cef load-sharing per-destination</b> | Enables load balancing for CEF. <ul style="list-style-type: none"> <li>• The <b>no ip cef load-sharing</b> command disables CEF load balancing.</li> <li>• The <b>per-packet</b> keyword enables per-packet load balancing on the interface.</li> <li>• The <b>per-destination</b> keyword enables per-destination load balancing on the interface.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                               |

## Configuring CEF Per-Packet Load Balancing

To configure CEF per-packet load balancing, perform the following procedure:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **[no] ip load-sharing [per-packet] [per-destination]**
5. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                     | Purpose                                                                                                                                                                                                                                                                      |
|--------|---------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device# <b>enable</b>                                                                             | Enters global configuration mode.                                                                                                                                                                                                                                            |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                     | Enters global configuration mode.                                                                                                                                                                                                                                            |
| Step 3 | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config-if)# <b>interface</b> gigabitethernet 1/0/1                  | Enters interface configuration mode, and specifies the Layer 3 interface to configure.                                                                                                                                                                                       |
| Step 4 | <b>[no] ip load-sharing [per-packet] [per-destination]</b><br><b>Example:</b><br>Device(config-if)# <b>ip load-sharing per-packet</b> | Enables load balancing for CEF. <ul style="list-style-type: none"> <li>• The <b>per-packet</b> keyword enables per-packet load balancing on the interface.</li> <li>• The <b>per-destination</b> keyword enables per-destination load balancing on the interface.</li> </ul> |
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                                                                             |

### Selecting a Tunnel Load-Balancing Algorithm for CEF Traffic

Select the tunnel algorithm when your network environment contains only a few source and destination pairs. The device is set to perform universal load sharing by default.

To select a tunnel load-balancing algorithm for CEF traffic, perform the following procedure:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip cef load-sharing algorithm {original | universal [*id*] }**
4. **end**

## DETAILED STEPS

|               | Command or Action                                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device# <b>enable</b>                                                                                                 | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                         | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>ip cef load-sharing algorithm {original   universal [<i>id</i>] }</b><br><b>Example:</b><br>Device(config)# ip cef load-sharing algorithm<br>universal | Selects a CEF load-balancing algorithm. <ul style="list-style-type: none"> <li>• The <b>original</b> keyword sets the load-balancing algorithm to the original algorithm, based on a source and destination hash.</li> <li>• The <b>universal</b> keyword sets the load-balancing algorithm to one that uses a source and destination and an ID hash.</li> <li>• The <i>id</i> argument is a fixed identifier.</li> </ul> |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                               | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                          |

## Configuration Examples for CEF Traffic Load-Balancing

The following sections provide configuration examples for CEF traffic load-balancing.

### Example: Enabling or Disabling CEF Per-Destination Load Balancing

Per-destination load balancing is enabled by default when you enable CEF. Typically, you disable per-destination load balancing when you want to enable per-packet load balancing. The following example shows how to disable per-destination load balancing:

```

Device> enable
Device# configure terminal
Device(config)# interface Ethernet1/0/1
Device(config-if)# no ip load-sharing per-destination
Device(config-if)# end

```

### Example: Configuring CEF Per-Packet Load Balancing

The following example shows how to configure per-packet load balancing for CEF:

```

Device> enable
Device# configure terminal
Device(config)# interface Ethernet1/0/1
Device(config-if)# ip load-sharing per-packet
Device(config-if)# end

```

## Number of Equal-Cost Routing Paths

### Information About Equal-Cost Routing Paths

When a router has two or more routes to the same network with the same metrics, these routes can be thought of as having an equal cost. The term parallel path is another way to see occurrences of equal-cost routes in a routing table. If a router has two or more equal-cost paths to a network, it can use them concurrently. Parallel paths provide redundancy in case of a circuit failure and also enable a router to load balance packets over the available paths for more efficient use of available bandwidth. Equal-cost routes are supported across switches in a stack.

Even though the router automatically learns about and configures equal-cost routes, you can control the maximum number of parallel paths supported by an IP routing protocol in its routing table. Although the switch software allows a maximum of 32 equal-cost routes, the switch hardware will never use more than 16 paths per route.

### How to Configure Equal-Cost Routing Paths

#### Procedure

|        | Command or Action                                                                           | Purpose                           |
|--------|---------------------------------------------------------------------------------------------|-----------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                  | Enters global configuration mode. |
| Step 2 | <b>router {bgp   rip   ospf   eigrp}</b><br><b>Example:</b><br>Device(config)# router eigrp | Enters router configuration mode. |

|               | Command or Action                                                                                          | Purpose                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>maximum-paths</b> <i>maximum</i><br><b>Example:</b><br>Device(config-router)# maximum-paths 2           | Sets the maximum number of parallel paths for the protocol routing table. The range is from 1 to 16; the default is 4 for most IP routing protocols, but only 1 for BGP. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config-router)# end                                                | Returns to privileged EXEC mode.                                                                                                                                         |
| <b>Step 5</b> | <b>show ip protocols</b><br><b>Example:</b><br>Device# show ip protocols                                   | Verifies the setting in the <i>Maximum path</i> field.                                                                                                                   |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file.                                                                                                                 |

## Static Unicast Routes

### Information About Static Unicast Routes

Static unicast routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the router cannot build a route to a particular destination and are useful for specifying a gateway of last resort to which all unroutable packets are sent.

The switch retains static routes until you remove them. However, you can override static routes with dynamic routing information by assigning administrative distance values. Each dynamic routing protocol has a default administrative distance, as listed in Table 41-16. If you want a static route to be overridden by information from a dynamic routing protocol, set the administrative distance of the static route higher than that of the dynamic protocol.

**Table 117: Dynamic Routing Protocol Default Administrative Distances**

| Route Source                | Default Distance |
|-----------------------------|------------------|
| Connected interface         | 0                |
| Static route                | 1                |
| Enhanced IRGP summary route | 5                |
| External BGP                | 20               |
| Internal Enhanced IGRP      | 90               |
| IGRP                        | 100              |

| Route Source | Default Distance |
|--------------|------------------|
| OSPF         | 110              |
| Internal BGP | 200              |
| Unknown      | 225              |

Static routes that point to an interface are advertised through RIP, IGRP, and other dynamic routing protocols, whether or not static **redistribute** router configuration commands were specified for those routing protocols. These static routes are advertised because static routes that point to an interface are considered in the routing table to be connected and hence lose their static nature. However, if you define a static route to an interface that is not one of the networks defined in a network command, no dynamic routing protocols advertise the route unless a **redistribute** static command is specified for these protocols.

When an interface goes down, all static routes through that interface are removed from the IP routing table. When the software can no longer find a valid next hop for the address specified as the forwarding router's address in a static route, the static route is also removed from the IP routing table.

## Configuring Static Unicast Routes

Static unicast routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the router cannot build a route to a particular destination and are useful for specifying a gateway of last resort to which all unroutable packets are sent.

Follow these steps to configure a static route:

### Procedure

|        | Command or Action                                                                                                                                        | Purpose                                                        |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                                         | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                                    | Enters the global configuration mode.                          |
| Step 3 | <b>ip route prefix mask {address   interface} [distance]</b><br><b>Example:</b><br><pre>Device(config)# ip route prefix mask gigabitethernet 1/0/4</pre> | Establish a static route.                                      |
| Step 4 | <b>end</b><br><b>Example:</b>                                                                                                                            | Returns to privileged EXEC mode.                               |

|               | Command or Action                                                                                          | Purpose                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
|               | Device(config)# <b>end</b>                                                                                 |                                                                              |
| <b>Step 5</b> | <b>show ip route</b><br><b>Example:</b><br>Device# show ip route                                           | Displays the current state of the routing table to verify the configuration. |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file.                     |

### What to do next

Use the **no ip route** *prefix mask {address| interface}* global configuration command to remove a static route. The device retains static routes until you remove them.

## Default Routes and Networks

### Information About Default Routes and Networks

A router might not be able to learn the routes to all other networks. To provide complete routing capability, you can use some routers as smart routers and give the remaining routers default routes to the smart router. (Smart routers have routing table information for the entire internetwork.) These default routes can be dynamically learned or can be configured in the individual routers. Most dynamic interior routing protocols include a mechanism for causing a smart router to generate dynamic default information that is then forwarded to other routers.

If a router has a directly connected interface to the specified default network, the dynamic routing protocols running on that device generate a default route. In RIP, it advertises the pseudonetwork 0.0.0.0.

A router that is generating the default for a network also might need a default of its own. One way a router can generate its own default is to specify a static route to the network 0.0.0.0 through the appropriate device.

When default information is passed through a dynamic routing protocol, no further configuration is required. The system periodically scans its routing table to choose the optimal default network as its default route. In IGRP networks, there might be several candidate networks for the system default. Cisco routers use administrative distance and metric information to set the default route or the gateway of last resort.

If dynamic default information is not being passed to the system, candidates for the default route are specified with the **ip default-network** global configuration command. If this network appears in the routing table from any source, it is flagged as a possible choice for the default route. If the router has no interface on the default network, but does have a path to it, the network is considered as a possible candidate, and the gateway to the best default path becomes the gateway of last resort.

## How to Configure Default Routes and Networks

### Procedure

|        | Command or Action                                                                                          | Purpose                                                                    |
|--------|------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                 | Enters global configuration mode.                                          |
| Step 2 | <b>ip default-network <i>network number</i></b><br><b>Example:</b><br>Device(config)# ip default-network 1 | Specifies a default network.                                               |
| Step 3 | <b>end</b><br><b>Example:</b><br>Device(config)# end                                                       | Returns to privileged EXEC mode.                                           |
| Step 4 | <b>show ip route</b><br><b>Example:</b><br>Device# show ip route                                           | Displays the selected default route in the gateway of last resort display. |
| Step 5 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file.                   |

## Route Maps to Redistribute Routing Information

### Information About Route Maps

The switch can run multiple routing protocols simultaneously, and it can redistribute information from one routing protocol to another. Redistributing information from one routing protocol to another applies to all supported IP-based routing protocols.

You can also conditionally control the redistribution of routes between routing domains by defining enhanced packet filters or route maps between the two domains. The **match** and **set** route-map configuration commands define the condition portion of a route map. The **match** command specifies that a criterion must be matched. The **set** command specifies an action to be taken if the routing update meets the conditions defined by the match command. Although redistribution is a protocol-independent feature, some of the **match** and **set** route-map configuration commands are specific to a particular protocol.

One or more **match** commands and one or more **set** commands follow a **route-map** command. If there are no **match** commands, everything matches. If there are no **set** commands, nothing is done, other than the match. Therefore, you need at least one **match** or **set** command.

**Note** A route map with no **set** route-map configuration commands is sent to the CPU, which causes high CPU utilization.

You can also identify route-map statements as **permit** or **deny**. If the statement is marked as a deny, the packets meeting the match criteria are sent back through the normal forwarding channels (destination-based routing). If the statement is marked as permit, set clauses are applied to packets meeting the match criteria. Packets that do not meet the match criteria are forwarded through the normal routing channel.

## How to Configure a Route Map

Although each of Steps 3 through 14 in the following section is optional, you must enter at least one **match** route-map configuration command and one **set** route-map configuration command.

**Note** The keywords are the same as defined in the procedure to control the route distribution.

### Procedure

|               | Command or Action                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# configure terminal                                                                                      | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 2</b> | <b>route-map</b> <i>map-tag</i> [ <b>permit</b>   <b>deny</b> ] [ <i>sequence number</i> ]<br><b>Example:</b><br>Device(config)# route-map rip-to-ospf permit 4 | Defines any route maps used to control redistribution and enter route-map configuration mode.<br><br><i>map-tag</i> —A meaningful name for the route map. The <b>redistribute</b> router configuration command uses this name to reference this route map. Multiple route maps might share the same map tag name.<br><br>(Optional) If <b>permit</b> is specified and the match criteria are met for this route map, the route is redistributed as controlled by the set actions. If <b>deny</b> is specified, the route is not redistributed.<br><br><i>sequence number</i> (Optional)— Number that indicates the position a new route map is to have in the list of route maps already configured with the same name. |
| <b>Step 3</b> | <b>match as-path</b> <i>path-list-number</i><br><b>Example:</b><br>Device(config-route-map)#match as-path 10                                                    | Matches a BGP AS path access list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 4</b> | <b>match community-list</b> <i>community-list-number</i> [ <b>exact</b> ]<br><b>Example:</b>                                                                    | Matches a BGP community list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                | Command or Action                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Device(config-route-map)# match community-list 150                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 5</b>  | <p><b>match ip address</b> {<i>access-list-number</i>   <i>access-list-name</i>} [...<i>access-list-number</i>   ...<i>access-list-name</i>]</p> <p><b>Example:</b></p> <pre>Device(config-route-map)# match ip address 5 80</pre>            | Matches a standard access list by specifying the name or number. It can be an integer from 1 to 199.                                                                                                                                                                                                                            |
| <b>Step 6</b>  | <p><b>match metric</b> <i>metric-value</i></p> <p><b>Example:</b></p> <pre>Device(config-route-map)# match metric 2000</pre>                                                                                                                  | Matches the specified route metric. The <i>metric-value</i> can be an EIGRP metric with a specified value from 0 to 4294967295.                                                                                                                                                                                                 |
| <b>Step 7</b>  | <p><b>match ip next-hop</b> {<i>access-list-number</i>   <i>access-list-name</i>} [...<i>access-list-number</i>   ...<i>access-list-name</i>]</p> <p><b>Example:</b></p> <pre>Device(config-route-map)# match ip next-hop 8 45</pre>          | Matches a next-hop router address passed by one of the access lists specified (numbered from 1 to 199).                                                                                                                                                                                                                         |
| <b>Step 8</b>  | <p><b>match tag</b> <i>tag value</i> [...<i>tag-value</i>]</p> <p><b>Example:</b></p> <pre>Device(config-route-map)# match tag 3500</pre>                                                                                                     | Matches the specified tag value in a list of one or more route tag values. Each can be an integer from 0 to 4294967295.                                                                                                                                                                                                         |
| <b>Step 9</b>  | <p><b>match interfacetype</b> <i>number</i> [...<i>type-number</i>]</p> <p><b>Example:</b></p> <pre>Device(config-route-map)# match interface gigabitethernet 1/0/1</pre>                                                                     | Matches the specified next hop route out one of the specified interfaces.                                                                                                                                                                                                                                                       |
| <b>Step 10</b> | <p><b>match ip route-source</b> {<i>access-list-number</i>   <i>access-list-name</i>} [...<i>access-list-number</i>   ...<i>access-list-name</i>]</p> <p><b>Example:</b></p> <pre>Device(config-route-map)# match ip route-source 10 30</pre> | Matches the address specified by the specified advertised access lists.                                                                                                                                                                                                                                                         |
| <b>Step 11</b> | <p><b>match route-type</b> {<i>local</i>   <i>internal</i>   <i>external</i> [<i>type-1</i>   <i>type-2</i>]}</p> <p><b>Example:</b></p> <pre>Device(config-route-map)# match route-type local</pre>                                          | Matches the specified <b>route-type</b> : <ul style="list-style-type: none"> <li>• <b>local</b>—Locally generated BGP routes.</li> <li>• <b>internal</b>—OSPF intra-area and interarea routes or EIGRP internal routes.</li> <li>• <b>external</b>—OSPF external routes (Type 1 or Type 2) or EIGRP external routes.</li> </ul> |

|                | Command or Action                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|----------------|----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                            | <ul style="list-style-type: none"> <li><i>loading</i>—Effective bandwidth of the route expressed as a number from 0 to 255 (255 is 100 percent loading).</li> <li><i>mtu</i>—Minimum maximum transmission unit (MTU) size of the route in bytes in the range 0 to 4294967295.</li> </ul> |
| <b>Step 19</b> | <b>set metric-type {type-1   type-2}</b><br><b>Example:</b><br><pre>Device(config-route-map)# set metric-type type-2</pre> | Sets the OSPF external metric type for redistributed routes.                                                                                                                                                                                                                             |
| <b>Step 20</b> | <b>set metric-type internal</b><br><b>Example:</b><br><pre>Device(config-route-map)# set metric-type internal</pre>        | Sets the multi-exit discriminator (MED) value on prefixes advertised to external BGP neighbor to match the IGP metric of the next hop.                                                                                                                                                   |
| <b>Step 21</b> | <b>set weight number</b><br><b>Example:</b><br><pre>Device(config-route-map)# set weight 100</pre>                         | Sets the BGP weight for the routing table. The value can be from 1 to 65535.                                                                                                                                                                                                             |
| <b>Step 22</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config-route-map)# end</pre>                                                  | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                         |
| <b>Step 23</b> | <b>show route-map</b><br><b>Example:</b><br><pre>Device# show route-map</pre>                                              | Displays all route maps configured or only the one specified to verify configuration.                                                                                                                                                                                                    |
| <b>Step 24</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre>      | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                 |

## How to Control Route Distribution

Although each of Steps 3 through 14 in the following section is optional, you must enter at least one **match** route-map configuration command and one **set** route-map configuration command.

**Note** The keywords are the same as defined in the procedure to configure the route map for redistribution.

The metrics of one routing protocol do not necessarily translate into the metrics of another. For example, the RIP metric is a hop count, and the IGRP metric is a combination of five qualities. In these situations, an artificial metric is assigned to the redistributed route. Uncontrolled exchanging of routing information between different routing protocols can create routing loops and seriously degrade network operation.

If you have not defined a default redistribution metric that replaces metric conversion, some automatic metric translations occur between routing protocols:

- RIP can automatically redistribute static routes. It assigns static routes a metric of 1 (directly connected).
- Any protocol can redistribute other routing protocols if a default mode is in effect.

### Procedure

|               | Command or Action                                                                                                                                                                                                                                                                                   | Purpose                                                                                                                                                                                                                                    |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# configure terminal                                                                                                                                                                                                                      | Enters global configuration mode.                                                                                                                                                                                                          |
| <b>Step 2</b> | <b>router { rip   ospf   eigrp }</b><br><b>Example:</b><br><br>Device(config)# router eigrp 10                                                                                                                                                                                                      | Enters router configuration mode.                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>redistribute protocol [process-id] {level-1   level-1-2   level-2} [metric metric-value] [metric-type type-value] [match internal   external type-value] [tag tag-value] [route-map map-tag] [weight weight] [subnets]</b><br><b>Example:</b><br><br>Device(config-router)# redistribute eigrp 1 | Redistributes routes from one routing protocol to another routing protocol. If no route-maps are specified, all routes are redistributed. If the keyword <b>route-map</b> is specified with no <i>map-tag</i> , no routes are distributed. |
| <b>Step 4</b> | <b>default-metric number</b><br><b>Example:</b><br><br>Device(config-router)# default-metric 1024                                                                                                                                                                                                   | Cause the current routing protocol to use the same metric value for all redistributed routes ( RIP and OSPF).                                                                                                                              |
| <b>Step 5</b> | <b>default-metric bandwidth delay reliability loading mtu</b><br><b>Example:</b><br><br>Device(config-router)# default-metric 1000 100 250 100 1500                                                                                                                                                 | Cause the EIGRP routing protocol to use the same metric value for all non-EIGRP redistributed routes.                                                                                                                                      |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br><br>Device(config-router)# end                                                                                                                                                                                                                                     | Returns to privileged EXEC mode.                                                                                                                                                                                                           |

|               | Command or Action                                                                                                     | Purpose                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
| <b>Step 7</b> | <b>show route-map</b><br><b>Example:</b><br><pre>Device# show route-map</pre>                                         | Displays all route maps configured or only the one specified to verify configuration. |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file.                              |

## Policy-Based Routing

### Information About Policy-Based Routing

You can use policy-based routing (PBR) to configure a defined policy for traffic flows. By using PBR, you can have more control over routing by reducing the reliance on routes derived from routing protocols. PBR can specify and implement routing policies that allow or deny paths based on:

- Identity of a particular end system
- Application
- Protocol

You can use PBR to provide equal-access and source-sensitive routing, routing based on interactive versus batch traffic, or routing based on dedicated links. For example, you could transfer stock records to a corporate office on a high-bandwidth, high-cost link for a short time while transmitting routine application data such as e-mail over a low-bandwidth, low-cost link.

With PBR, you classify traffic using access control lists (ACLs) and then make traffic go through a different path. PBR is applied to incoming packets. All packets received on an interface with PBR enabled are passed through route maps. Based on the criteria defined in the route maps, packets are forwarded (routed) to the appropriate next hop.

- Route map statement marked as permit is processed as follows:
  - A match command can match on length or multiple ACLs. A route map statement can contain multiple match commands. Logical or algorithm function is performed across all the match commands to reach a permit or deny decision.

For example:

```
match length A B
match ip address acl1 acl2
match ip address acl3
```

A packet is permitted if it is permitted by match length A B or acl1 or acl2 or acl3

- If the decision reached is permit, then the action specified by the set command is applied on the packet .

- If the decision reached is deny, then the PBR action (specified in the set command) is not applied. Instead the processing logic moves forward to look at the next route-map statement in the sequence (the statement with the next higher sequence number). If no next statement exists, PBR processing terminates, and the packet is routed using the default IP routing table.
- For PBR, route-map statements marked as deny are not supported.

You can use standard IP ACLs to specify match criteria for a source address or extended IP ACLs to specify match criteria based on an application, a protocol type, or an end station. The process proceeds through the route map until a match is found. If no match is found, normal destination-based routing occurs. There is an implicit deny at the end of the list of match statements.

If match clauses are satisfied, you can use a set clause to specify the IP addresses identifying the next hop router in the path.

For details about PBR commands and keywords, see *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols*.

## How to Configure PBR

- To use PBR, you must have the IP Base feature set enabled on the switch or stack master.
- Multicast traffic is not policy-routed. PBR applies only to unicast traffic.
- You can enable PBR on a routed port or an SVI.
- The switch supports PBR based on match length.
- You can apply a policy route map to an EtherChannel port channel in Layer 3 mode, but you cannot apply a policy route map to a physical interface that is a member of the EtherChannel. If you try to do so, the command is rejected. When a policy route map is applied to a physical interface, that interface cannot become a member of an EtherChannel.
- You can define a maximum of 128 IP policy route maps on the switch or switch stack.
- You can define a maximum of 512 access control entries (ACEs) for PBR on the switch or switch stack.
- When configuring match criteria in a route map, follow these guidelines:
  - Do not match ACLs that permit packets destined for a local address.
- VRF and PBR are mutually exclusive on a switch interface. You cannot enable VRF when PBR is enabled on an interface. The reverse is also true, you cannot enable PBR when VRF is enabled on an interface.
- Web Cache Communication Protocol (WCCP) and PBR are mutually exclusive on a switch interface. You cannot enable WCCP when PBR is enabled on an interface. The reverse is also true, you cannot enable PBR when WCCP is enabled on an interface.
- The number of hardware entries used by PBR depends on the route map itself, the ACLs used, and the order of the ACLs and route-map entries.
- PBR based on TOS, DSCP and IP Precedence are not supported.
- Set interface, set default next-hop and set default interface are not supported.
- **ip next-hop recursive** and **ip next-hop verify availability** features are not available and the next-hop should be directly connected.
- Policy-maps with no set actions are supported. Matching packets are routed normally.

- Policy-maps with no match clauses are supported. Set actions are applied to all packets.

By default, PBR is disabled on the switch. To enable PBR, you must create a route map that specifies the match criteria and the resulting action. Then, you must enable PBR for that route map on an interface. All packets arriving on the specified interface matching the match clauses are subject to PBR.

Packets that are generated by the switch, or local packets, are not normally policy-routed. When you globally enable local PBR on the switch, all packets that originate on the switch are subject to local PBR. Local PBR is disabled by default.

## SUMMARY STEPS

1. **configure terminal**
2. **route-map** *map-tag* [**permit**] [*sequence number*]
3. **match ip address** {*access-list-number* | *access-list-name*} [*access-list-number* |...*access-list-name*]
4. **match length** *min max*
5. **set ip next-hop** *ip-address* [...*ip-address*]
6. **exit**
7. **interface** *interface-id*
8. **ip policy route-map** *map-tag*
9. **ip route-cache policy**
10. **exit**
11. **ip local policy route-map** *map-tag*
12. **end**
13. **show route-map** [*map-name*]
14. **show ip policy**
15. **show ip local policy**

## DETAILED STEPS

|               | Command or Action                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                  | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 2</b> | <b>route-map</b> <i>map-tag</i> [ <b>permit</b> ] [ <i>sequence number</i> ]<br><b>Example:</b><br>Device(config)# <code>route-map pbr-map permit</code> | Defines route maps that are used to control where packets are output, and enters route-map configuration mode. <ul style="list-style-type: none"> <li>• <i>map-tag</i> – A meaningful name for the route map. The <b>ip policy route-map</b> interface configuration command uses this name to reference the route map. Multiple route-map statements with the same map tag define a single route map.</li> <li>• (Optional) <b>permit</b> – If <b>permit</b> is specified and the match criteria are met for this route map, the route is policy routed as defined by the set actions.</li> </ul> |

|                | Command or Action                                                                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                              |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                |                                                                                                                                                                                                                                 | <ul style="list-style-type: none"> <li>(Optional) <i>sequence number</i> – The sequence number shows the position of the route-map statement in the given route map.</li> </ul>                                                                                                                                                                      |
| <b>Step 3</b>  | <b>match ip address</b> { <i>access-list-number</i>   <i>access-list-name</i> } [ <i>access-list-number</i>   ... <i>access-list-name</i> ]<br><b>Example:</b><br><pre>Device(config-route-map)# match ip address 110 140</pre> | <p>Matches the source and destination IP addresses that are permitted by one or more standard or extended access lists. ACLs can match on more than one source and destination IP address.</p> <p>If you do not specify a <b>match</b> command, the route map is applicable to all packets.</p>                                                      |
| <b>Step 4</b>  | <b>match length min max</b><br><b>Example:</b><br><pre>Device(config-route-map)# match length 64 1500</pre>                                                                                                                     | Matches the length of the packet.                                                                                                                                                                                                                                                                                                                    |
| <b>Step 5</b>  | <b>set ip next-hop ip-address</b> [... <i>ip-address</i> ]<br><b>Example:</b><br><pre>Device(config-route-map)# set ip next-hop 10.1.6.2</pre>                                                                                  | Specifies the action to be taken on the packets that match the criteria. Sets next hop to which to route the packet (the next hop must be adjacent).                                                                                                                                                                                                 |
| <b>Step 6</b>  | <b>exit</b><br><b>Example:</b><br><pre>Device(config-route-map)# exit</pre>                                                                                                                                                     | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                |
| <b>Step 7</b>  | <b>interface interface-id</b><br><b>Example:</b><br><pre>Device(config)# interface gigabitethernet 1/0/1</pre>                                                                                                                  | Enters interface configuration mode, and specifies the interface to be configured.                                                                                                                                                                                                                                                                   |
| <b>Step 8</b>  | <b>ip policy route-map map-tag</b><br><b>Example:</b><br><pre>Device(config-if)# ip policy route-map pbr-map</pre>                                                                                                              | Enables PBR on a Layer 3 interface, and identify the route map to use. You can configure only one route map on an interface. However, you can have multiple route map entries with different sequence numbers. These entries are evaluated in the order of sequence number until the first match. If there is no match, packets are routed as usual. |
| <b>Step 9</b>  | <b>ip route-cache policy</b><br><b>Example:</b><br><pre>Device(config-if)# ip route-cache policy</pre>                                                                                                                          | (Optional) Enables fast-switching PBR. You must enable PBR before enabling fast-switching PBR.                                                                                                                                                                                                                                                       |
| <b>Step 10</b> | <b>exit</b><br><b>Example:</b><br><pre>Device(config-if)# exit</pre>                                                                                                                                                            | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                                |
| <b>Step 11</b> | <b>ip local policy route-map map-tag</b><br><b>Example:</b><br><pre>Device(config)# ip local policy route-map local-pbr</pre>                                                                                                   | (Optional) Enables local PBR to perform policy-based routing on packets originating at the switch. This applies to packets generated by the switch, and not to incoming packets.                                                                                                                                                                     |

|         | Command or Action                                                              | Purpose                                                                                                  |
|---------|--------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| Step 12 | <b>end</b><br><b>Example:</b><br>Device(config)# end                           | Returns to privileged EXEC mode.                                                                         |
| Step 13 | <b>show route-map [map-name]</b><br><b>Example:</b><br>Device# show route-map  | (Optional) Displays all the route maps configured or only the one specified to verify configuration.     |
| Step 14 | <b>show ip policy</b><br><b>Example:</b><br>Device# show ip policy             | (Optional) Displays policy route maps attached to the interface.                                         |
| Step 15 | <b>show ip local policy</b><br><b>Example:</b><br>Device# show ip local policy | (Optional) Displays whether or not local policy routing is enabled and, if so, the route map being used. |

## Filtering Routing Information

You can filter routing protocol information by performing the tasks described in this section.

**Note** When routes are redistributed between OSPF processes, no OSPF metrics are preserved.

## Setting Passive Interfaces

To prevent other routers on a local network from dynamically learning about routes, you can use the **passive-interface** router configuration command to keep routing update messages from being sent through a router interface. When you use this command in the OSPF protocol, the interface address you specify as passive appears as a stub network in the OSPF domain. OSPF routing information is neither sent nor received through the specified router interface.

In networks with many interfaces, to avoid having to manually set them as passive, you can set all interfaces to be passive by default by using the **passive-interface default** router configuration command and manually setting interfaces where adjacencies are desired.

Use a network monitoring privileged EXEC command such as **show ip ospf interface** to verify the interfaces that you enabled as passive, or use the **show ip interface** privileged EXEC command to verify the interfaces that you enabled as active.

### Procedure

|        | Command or Action                            | Purpose                           |
|--------|----------------------------------------------|-----------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b> | Enters global configuration mode. |

|               | Command or Action                                                                                                                                       | Purpose                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
|               | Device# configure terminal                                                                                                                              |                                                                                                                 |
| <b>Step 2</b> | <b>router { rip   ospf   eigrp }</b><br><b>Example:</b><br>Device(config)# router ospf                                                                  | Enters router configuration mode.                                                                               |
| <b>Step 3</b> | <b>passive-interface interface-id</b><br><b>Example:</b><br>Device(config-router)# passive-interface gigabitethernet 1/0/1                              | Suppresses sending routing updates through the specified Layer 3 interface.                                     |
| <b>Step 4</b> | <b>passive-interface default</b><br><b>Example:</b><br>Device(config-router)# passive-interface default                                                 | (Optional) Sets all interfaces as passive by default.                                                           |
| <b>Step 5</b> | <b>no passive-interface interface type</b><br><b>Example:</b><br>Device(config-router)# no passive-interface gigabitethernet1/0/3 gigabitethernet 1/0/5 | (Optional) Activates only those interfaces that need to have adjacencies sent.                                  |
| <b>Step 6</b> | <b>network network-address</b><br><b>Example:</b><br>Device(config-router)# network 10.1.1.1                                                            | (Optional) Specifies the list of networks for the routing process. The <i>network-address</i> is an IP address. |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br>Device(config-router)# end                                                                                             | Returns to privileged EXEC mode.                                                                                |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# copy running-config startup-config                                              | (Optional) Saves your entries in the configuration file.                                                        |

## Controlling Advertising and Processing in Routing Updates

You can use the **distribute-list** router configuration command with access control lists to suppress routes from being advertised in routing updates and to prevent other routers from learning one or more routes. When used in OSPF, this feature applies to only external routes, and you cannot specify an interface name.

You can also use a **distribute-list** router configuration command to avoid processing certain routes listed in incoming updates. (This feature does not apply to OSPF.)

## Procedure

|               | Command or Action                                                                                                                                                                                                                       | Purpose                                                                                                                 |

## Filtering Sources of Routing Information

Because some routing information might be more accurate than others, you can use filtering to prioritize information coming from different sources. An administrative distance is a rating of the trustworthiness of a routing information source, such as a router or group of routers. In a large network, some routing protocols can be more reliable than others. By specifying administrative distance values, you enable the router to intelligently discriminate between sources of routing information. The router always picks the route whose routing protocol has the lowest administrative distance.

Because each network has its own requirements, there are no general guidelines for assigning administrative distances.

## Procedure

|               | Command or Action                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# configure terminal                                                               | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# copy running-config startup-config                               | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Managing Authentication Keys

Key management is a method of controlling authentication keys used by routing protocols. Not all protocols can use key management. Authentication keys are available for EIGRP and RIP Version 2.

### Prerequisites

Before you manage authentication keys, you must enable authentication. See the appropriate protocol section to see how to enable authentication for that protocol. To manage authentication keys, define a key chain, identify the keys that belong to the key chain, and specify how long each key is valid. Each key has its own key identifier (specified with the **key number** key chain configuration command), which is stored locally. The

combination of the key identifier and the interface associated with the message uniquely identifies the authentication algorithm and Message Digest 5 (MD5) authentication key in use.

## How to Configure Authentication Keys

You can configure multiple keys with life times. Only one authentication packet is sent, regardless of how many valid keys exist. The software examines the key numbers in order from lowest to highest, and uses the first valid key it encounters. The lifetimes allow for overlap during key changes. Note that the router must know these lifetimes.

### Procedure

|        | Command or Action                                                                                                                                                                                              | Purpose                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                                                                                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                         |
| Step 2 | <b>key chain <i>name-of-chain</i></b><br><b>Example:</b><br><pre>Device(config)# key chain key10</pre>                                                                                                         | Identifies a key chain, and enter key chain configuration mode.                                                                                                                                                                                                                                                                                                                                           |
| Step 3 | <b>key number</b><br><b>Example:</b><br><pre>Device(config-keychain)# key 2000</pre>                                                                                                                           | Identifies the key number. The range is 0 to 2147483647.                                                                                                                                                                                                                                                                                                                                                  |
| Step 4 | <b>key-string <i>text</i></b><br><b>Example:</b><br><pre>Device(config-keychain)# Room 20, 10th floor</pre>                                                                                                    | Identifies the key string. The string can contain from 1 to 80 uppercase and lowercase alphanumeric characters, but the first character cannot be a number.                                                                                                                                                                                                                                               |
| Step 5 | <b>accept-lifetime <i>start-time</i> {infinite   <i>end-time</i>   <i>duration</i> <i>seconds</i>}</b><br><b>Example:</b><br><pre>Device(config-keychain)# accept-lifetime 12:30:00 Jan 25 1009 infinite</pre> | (Optional) Specifies the time period during which the key can be received.<br><br>The <i>start-time</i> and <i>end-time</i> syntax can be either <i>hh:mm:ss Month date year</i> or <i>hh:mm:ss date Month year</i> . The default is forever with the default <i>start-time</i> and the earliest acceptable date as January 1, 1993. The default <i>end-time</i> and <b>duration</b> is <b>infinite</b> . |
| Step 6 | <b>send-lifetime <i>start-time</i> {infinite   <i>end-time</i>   <i>duration</i> <i>seconds</i>}</b><br><b>Example:</b><br><pre>Device(config-keychain)# accept-lifetime 23:30:00 Jan 25 1019 infinite</pre>   | (Optional) Specifies the time period during which the key can be sent.<br><br>The <i>start-time</i> and <i>end-time</i> syntax can be either <i>hh:mm:ss Month date year</i> or <i>hh:mm:ss date Month year</i> . The default is forever with the default <i>start-time</i> and the earliest acceptable date as January 1, 1993. The default <i>end-time</i> and <b>duration</b> is <b>infinite</b> .     |

|               | Command or Action                                                                                              | Purpose                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br><br>Device(config-keychain)# end                                              | Returns to privileged EXEC mode.                         |
| <b>Step 8</b> | <b>show key chain</b><br><b>Example:</b><br><br>Device# show key chain                                         | Displays authentication key information.                 |
| <b>Step 9</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

## Monitoring and Maintaining the IP Network

You can remove all contents of a particular cache, table, or database. You can also display specific statistics.

**Table 118: Commands to Clear IP Routes or Display Route Status**

|                                                                                                                              |                                                                           |
|------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| <b>clear ip route</b> { <i>network</i> [ <i>mask</i>   *]}                                                                   | Clears one or more routes from the IP routing table.                      |
| <b>show ip protocols</b>                                                                                                     | Displays the parameters and state of the active routing protocol process. |
| <b>show ip route</b> [ <i>address</i> [ <i>mask</i> ] [ <b>longer-prefixes</b> ]]   [ <i>protocol</i> [ <i>process-id</i> ]] | Displays the current state of the routing table.                          |
| <b>show ip route summary</b>                                                                                                 | Displays the current state of the routing table in summary form.          |
| <b>show ip route supernets-only</b>                                                                                          | Displays supernets.                                                       |
| <b>show ip cache</b>                                                                                                         | Displays the routing table used to switch IP traffic.                     |
| <b>show route-map</b> [ <i>map-name</i> ]                                                                                    | Displays all route maps configured or only the one specified.             |

# Preventing Unauthorized Access

---

- [Finding Feature Information, on page 1503](#)
- [Preventing Unauthorized Access, on page 1503](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Preventing Unauthorized Access

You can prevent unauthorized users from reconfiguring your switch and viewing configuration information. Typically, you want network administrators to have access to your switch while you restrict access to users who dial from outside the network through an asynchronous port, connect from outside the network through a serial port, or connect through a terminal or workstation from within the local network.

To prevent unauthorized access into your switch, you should configure one or more of these security features:

- At a minimum, you should configure passwords and privileges at each switch port. These passwords are locally stored on the switch. When users attempt to access the switch through a port or line, they must enter the password specified for the port or line before they can access the switch.
- For an additional layer of security, you can also configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.
- If you want to use username and password pairs, but you want to store them centrally on a server instead of locally, you can store them in a database on a security server. Multiple networking devices can then use the same database to obtain user authentication (and, if necessary, authorization) information.

- You can also enable the login enhancements feature, which logs both failed and unsuccessful login attempts. Login enhancements can also be configured to block future login attempts after a set number of unsuccessful attempts are made. For more information, see the Cisco IOS Login Enhancements documentation.

## Restrictions for Controlling Switch Access with Passwords and Privileges

The following are the restrictions for controlling switch access with passwords and privileges:

- Disabling password recovery will not work if you have set the switch to boot up manually by using the **boot manual** global configuration command. This command produces the boot loader prompt (*switch:*) after the switch is power cycled.

# Information About Passwords and Privilege Levels

## Default Password and Privilege Level Configuration

A simple way of providing terminal access control in your network is to use passwords and assign privilege levels. Password protection restricts access to a network or network device. Privilege levels define what commands users can enter after they have logged into a network device.

This table shows the default password and privilege level configuration.

**Table 119: Default Password and Privilege Levels**

| Feature                                    | Default Setting                                                                                                                                    |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Enable password and privilege level        | No password is defined. The default is level 15 (privileged EXEC level). The password is not encrypted in the configuration file.                  |
| Enable secret password and privilege level | No password is defined. The default is level 15 (privileged EXEC level). The password is encrypted before it is written to the configuration file. |
| Line password                              | No password is defined.                                                                                                                            |

## Additional Password Security

To provide an additional layer of security, particularly for passwords that cross the network or that are stored on a Trivial File Transfer Protocol (TFTP) server, you can use either the **enable password** or **enable secret** global configuration commands. Both commands accomplish the same thing; that is, you can establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify.

We recommend that you use the **enable secret** command because it uses an improved encryption algorithm.

If you configure the **enable secret** command, it takes precedence over the **enable password** command; the two commands cannot be in effect simultaneously.

If you enable password encryption, it applies to all passwords including username passwords, authentication key passwords, the privileged command password, and console and virtual terminal line passwords.

## Password Recovery

By default, any end user with physical access to the switch can recover from a lost password by interrupting the boot process while the switch is powering on and then by entering a new password.

The password-recovery disable feature protects access to the switch password by disabling part of this functionality. When this feature is enabled, the end user can interrupt the boot process only by agreeing to set

the system back to the default configuration. With password recovery disabled, you can still interrupt the boot process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted.

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

To re-enable password recovery, use the **service password-recovery** global configuration command.

[Restrictions for Controlling Switch Access with Passwords and Privileges](#), on page 1505

## Terminal Line Telnet Configuration

When you power-up your switch for the first time, an automatic setup program runs to assign IP information and to create a default configuration for continued use. The setup program also prompts you to configure your switch for Telnet access through a password. If you did not configure this password during the setup program, you can configure it when you set a Telnet password for a terminal line.

#### Related Topics

[Setting a Telnet Password for a Terminal Line](#), on page 1513

[Example: Setting a Telnet Password for a Terminal Line](#), on page 1520

## Username and Password Pairs

You can configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

#### Related Topics

[Configuring Username and Password Pairs](#), on page 1514

## Privilege Levels

Cisco switches (and other devices) use privilege levels to provide password security for different levels of switch operation. By default, the Cisco IOS software operates in two modes (privilege levels) of password security: user EXEC (Level 1) and privileged EXEC (Level 15). You can configure up to 16 hierarchical levels of commands for each mode. By configuring multiple passwords, you can allow different sets of users to have access to specified commands.

#### Privilege Levels on Lines

Users can override the privilege level you set using the **privilege level** line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the **disable** command. If users know the password to a higher privilege level, they can use that password to enable the

higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

For example, if you want many users to have access to the **clear line** command, you can assign it level 2 security and distribute the level 2 password fairly widely. But if you want more restricted access to the **configure** command, you can assign it level 3 security and distribute that password to a more restricted group of users.

### Command Privilege Levels

When you set a command to a privilege level, all commands whose syntax is a subset of that command are also set to that level. For example, if you set the **show ip traffic** command to level 15, the **show** commands and **show ip** commands are automatically set to privilege level 15 unless you set them individually to different levels.

# How to Control Switch Access with Passwords and Privilege Levels

## Setting or Changing a Static Enable Password

The enable password controls access to the privileged EXEC mode. Follow these steps to set or change a static enable password:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **enable password** *password*
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                         | Purpose                                                        |
|---------------|-----------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b> | Enables privileged EXEC mode. Enter your password if prompted. |

|        | Command or Action                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                 | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 3 | <b>enable password <i>password</i></b><br><b>Example:</b><br>Device(config)# <code>enable password secret321</code>     | <p>Defines a new password or changes an existing password for access to privileged EXEC mode.</p> <p>By default, no password is defined.</p> <p>For <i>password</i>, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. It can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password abc?123, do this:</p> <ol style="list-style-type: none"> <li>Enter <code>abc</code>.</li> <li>Enter <code>Ctrl-v</code>.</li> <li>Enter <code>?123</code>.</li> </ol> <p>When the system prompts you to enter the enable password, you need not precede the question mark with the Ctrl-v; you can simply enter abc?123 at the password prompt.</p> |
| Step 4 | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Step 5 | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                               | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 6 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Protecting Enable and Enable Secret Passwords with Encryption

Follow these steps to establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. Use one of the following:
  - `enable password [level level] {password encryption-type encrypted-password}`
  - `enable secret [level level] {password encryption-type encrypted-password}`
4. **service password-encryption**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Disabling Password Recovery

Follow these steps to disable password recovery to protect the security of your switch:

**Before you begin**

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **no service password-recovery**
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

**DETAILED STEPS**

|               | Command or Action                                                                                             | Purpose                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                     | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                  |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                             | Enters the global configuration mode.                                                                                                                                                                                           |
| <b>Step 3</b> | <b>no service password-recovery</b><br><b>Example:</b><br>Device(config)# <b>no service password-recovery</b> | Disables password recovery.<br><br>This setting is saved in an area of the flash memory that is accessible by the boot loader and the Cisco IOS image, but it is not part of the file system and is not accessible by any user. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                   | Returns to privileged EXEC mode.                                                                                                                                                                                                |
| <b>Step 5</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                           | Verifies your entries.                                                                                                                                                                                                          |

|        | Command or Action                                                                                                       | Purpose                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 6 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

**What to do next**

To re-enable password recovery, use the **service password-recovery** global configuration command.

## Setting a Telnet Password for a Terminal Line

Beginning in user EXEC mode, follow these steps to set a Telnet password for the connected terminal line:

**Before you begin**

- Attach a PC or workstation with emulation software to the switch console port, or attach a PC to the Ethernet management port.
- The default data characteristics of the console port are 9600, 8, 1, no parity. You might need to press the Return key several times to see the command-line prompt.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **line vty 0 15**
4. **password *password***
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

**DETAILED STEPS**

|        | Command or Action                                               | Purpose                                                                                                                                    |

## Configuring Username and Password Pairs

Follow these steps to configure username and password pairs:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`

3. **username** *name* [**privilege level**] {**password** *encryption-type password*}
4. Use one of the following:
  - **line console 0**
  - **line vty 0 15**
5. **login local**
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                                                                                             | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                                     | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 3</b> | <b>username</b> <i>name</i> [ <b>privilege level</b> ] { <b>password</b> <i>encryption-type password</i> } <b>Example:</b><br>Device(config)# <b>username adamsample privilege 1 password secret456</b><br>Device(config)# <b>username 111111111111 mac attribute</b> | Sets the username, privilege level, and password for each user. <ul style="list-style-type: none"> <li>• For <i>name</i>, specify the user ID as one word or the MAC address. Spaces and quotation marks are not allowed.</li> <li>• You can configure a maximum of 12000 clients each, for both username and MAC filter.</li> <li>• (Optional) For <i>level</i>, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 1 gives user EXEC mode access.</li> <li>• For <i>encryption-type</i>, enter 0 to specify that an unencrypted password will follow. Enter 7 to specify that a hidden password will follow.</li> <li>• For <i>password</i>, specify the password the user must enter to gain access to the Device. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the <b>username</b> command.</li> </ul> |
| <b>Step 4</b> | Use one of the following: <ul style="list-style-type: none"> <li>• <b>line console 0</b></li> </ul>                                                                                                                                                                   | Enters line configuration mode, and configures the console port (line 0) or the VTY lines (line 0 to 15).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|               | Command or Action                                                                                                                                                                                | Purpose                                                                                                     |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
|               | <ul style="list-style-type: none"> <li>• <code>line vty 0 15</code></li> </ul> <p><b>Example:</b></p> <pre>Device(config)# line console 0</pre> <p>or</p> <pre>Device(config)# line vty 15</pre> |                                                                                                             |
| <b>Step 5</b> | <p><b>login local</b></p> <p><b>Example:</b></p> <pre>Device(config-line)# login local</pre>                                                                                                     | Enables local password checking at login time. Authentication is based on the username specified in Step 3. |
| <b>Step 6</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                                          | Returns to privileged EXEC mode.                                                                            |
| <b>Step 7</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>                                                                                                  | Verifies your entries.                                                                                      |
| <b>Step 8</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                                                    | (Optional) Saves your entries in the configuration file.                                                    |

## Setting the Privilege Level for a Command

Follow these steps to set the privilege level for a command:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `privilege mode level level command`
4. `enable password level level password`

5. `end`
6. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><code>enable</code></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                   | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Step 2 | <p><code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                              | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Step 3 | <p><code>privilege mode level level command</code></p> <p><b>Example:</b></p> <pre>Device(config)# privilege exec level 14 configure</pre>       | <p>Sets the privilege level for a command.</p> <ul style="list-style-type: none"> <li>For <i>mode</i>, enter <b>configure</b> for global configuration mode, <b>exec</b> for EXEC mode, <b>interface</b> for interface configuration mode, or <b>line</b> for line configuration mode.</li> <li>For <i>level</i>, the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges. Level 15 is the level of access permitted by the <b>enable</b> password.</li> <li>For <i>command</i>, specify the command to which you want to restrict access.</li> </ul> |
| Step 4 | <p><code>enable password level level password</code></p> <p><b>Example:</b></p> <pre>Device(config)# enable password level 14 SecretPswd14</pre> | <p>Specifies the password to enable the privilege level.</p> <ul style="list-style-type: none"> <li>For <i>level</i>, the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges.</li> <li>For <i>password</i>, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.</li> </ul>                                                                                                                            |
| Step 5 | <p><code>end</code></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Step 6 | <p><code>copy running-config startup-config</code></p> <p><b>Example:</b></p>                                                                    | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|  | Command or Action                                       | Purpose |
|--|---------------------------------------------------------|---------|
|  | Device# <code>copy running-config startup-config</code> |         |

## Changing the Default Privilege Level for Lines

Follow these steps to change the default privilege level for the specified line:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `line vty line`
4. `privilege level level`
5. `end`
6. `copy running-config startup-config`

### DETAILED STEPS

|               | Command or Action                                                                                              | Purpose                                                                                                                                                                                                                      |
|---------------|----------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><code>enable</code></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                 | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                               |
| <b>Step 2</b> | <p><code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>            | Enters the global configuration mode.                                                                                                                                                                                        |
| <b>Step 3</b> | <p><code>line vty line</code></p> <p><b>Example:</b></p> <pre>Device(config)# line vty 10</pre>                | Selects the virtual terminal line on which to restrict access.                                                                                                                                                               |
| <b>Step 4</b> | <p><code>privilege level level</code></p> <p><b>Example:</b></p> <pre>Device(config)# privilege level 15</pre> | Changes the default privilege level for the line.<br>For <i>level</i> , the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges. Level 15 is the level of access permitted by the <b>enable</b> password. |

|        | Command or Action                                                                                                 | Purpose                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 5 | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                         |
| Step 6 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

### What to do next

Users can override the privilege level you set using the **privilege level** line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the **disable** command. If users know the password to a higher privilege level, they can use that password to enable the higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

## Configuration Examples for Setting Passwords and Privilege Levels

### Example: Setting or Changing a Static Enable Password

This example shows how to change the enable password to `11u2c3k4y5`. The password is not encrypted and provides access to level 15 (traditional privileged EXEC mode access):

```
Device(config)# enable password 11u2c3k4y5
```

## Example: Setting the Privilege Level for a Command

This example shows how to set the **configure** command to privilege level 14 and define *SecretPswd14* as the password users must enter to use level 14 commands:

```
Device(config)# privilege exec level 14 configure
Device(config)# enable password level 14 SecretPswd14
```

## CHAPTER 76

# Configuring TACACS+

- [Finding Feature Information, on page 1523](#)
- [Prerequisites for TACACS+, on page 1523](#)
- [Information About TACACS+, on page 1525](#)
- [How to Configure TACACS+, on page 1528](#)
- [Monitoring TACACS+, on page 1536](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for TACACS+

The following are the prerequisites for set up and configuration of switch access with TACACS+ (must be performed in the order presented):

1. Configure the switches with the TACACS+ server addresses.
2. Set an authentication key.
3. Configure the key from Step 2 on the TACACS+ servers.
4. Enable authentication, authorization, and accounting (AAA).
5. Create a login authentication method list.
6. Apply the list to the terminal lines.
7. Create an authorization and accounting method list.

The following are the prerequisites for controlling switch access with TACACS+:

- You must have access to a configured TACACS+ server to configure TACACS+ features on your switch. Also, you must have access to TACACS+ services maintained in a database on a TACACS+ daemon typically running on a LINUX or Windows workstation.
- We recommend a redundant connection between a switch stack and the TACACS+ server. This is to help ensure that the TACACS+ server remains accessible in case one of the connected stack members is removed from the switch stack.
- You need a system running the TACACS+ daemon software to use TACACS+ on your switch.
- To use TACACS+, it must be enabled.
- Authorization must be enabled on the switch to be used.
- Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.
- To use any of the AAA commands listed in this section or elsewhere, you must first enable AAA with the **aaa new-model** command.
- At a minimum, you must identify the host or hosts maintaining the TACACS+ daemon and define the method lists for TACACS+ authentication. You can optionally define method lists for TACACS+ authorization and accounting.
- The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named *default*). The default method list is automatically applied to all ports except those that have a named method list explicitly defined. A defined method list overrides the default method list.
- Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.
- Use the local database if authentication was not performed by using TACACS+.

# Information About TACACS+

## TACACS+ and Switch Access

This section describes TACACS+. TACACS+ provides detailed accounting information and flexible administrative control over the authentication and authorization processes. It is facilitated through authentication, authorization, accounting (AAA) and can be enabled only through AAA commands.

## TACACS+ Overview

TACACS+ is a security application that provides centralized validation of users attempting to gain access to your switch.

TACACS+ provides for separate and modular authentication, authorization, and accounting facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service—authentication, authorization, and accounting—independently. Each service can be tied into its own database to take advantage of other services available on that server or on the network, depending on the capabilities of the daemon.

The goal of TACACS+ is to provide a method for managing multiple network access points from a single management service. Your switch can be a network access server along with other Cisco routers and access servers.

**Figure 90: Typical TACACS+ Network Configuration**

TACACS+, administered through the AAA security services, can provide these services:

- **Authentication**—Provides complete control of authentication through login and password dialog, challenge and response, and messaging support.

The authentication facility can conduct a dialog with the user (for example, after a username and password are provided, to challenge a user with several questions, such as home address, mother's maiden name, service type, and social security number). The TACACS+ authentication service can also send messages to user screens. For example, a message could notify users that their passwords must be changed because of the company's password aging policy.

- **Authorization**—Provides fine-grained control over user capabilities for the duration of the user's session, including but not limited to setting autocommands, access control, session duration, or protocol support. You can also enforce restrictions on what commands a user can execute with the TACACS+ authorization feature.
- **Accounting**—Collects and sends information used for billing, auditing, and reporting to the TACACS+ daemon. Network managers can use the accounting facility to track user activity for a security audit or to provide information for user billing. Accounting records include user identities, start and stop times, executed commands (such as PPP), number of packets, and number of bytes.

The TACACS+ protocol provides authentication between the switch and the TACACS+ daemon, and it ensures confidentiality because all protocol exchanges between the switch and the TACACS+ daemon are encrypted.

## TACACS+ Operation

When a user attempts a simple ASCII login by authenticating to a switch using TACACS+, this process occurs:

1. When the connection is established, the switch contacts the TACACS+ daemon to obtain a username prompt to show to the user. The user enters a username, and the switch then contacts the TACACS+ daemon to obtain a password prompt. The switch displays the password prompt to the user, the user enters a password, and the password is then sent to the TACACS+ daemon.

TACACS+ allows a dialog between the daemon and the user until the daemon receives enough information to authenticate the user. The daemon prompts for a username and password combination, but can include other items, such as the user's mother's maiden name.

2. The switch eventually receives one of these responses from the TACACS+ daemon:
  - **ACCEPT**—The user is authenticated and service can begin. If the switch is configured to require authorization, authorization begins at this time.
  - **REJECT**—The user is not authenticated. The user can be denied access or is prompted to retry the login sequence, depending on the TACACS+ daemon.
  - **ERROR**—An error occurred at some time during authentication with the daemon or in the network connection between the daemon and the switch. If an ERROR response is received, the switch typically tries to use an alternative method for authenticating the user.
  - **CONTINUE**—The user is prompted for additional authentication information.

After authentication, the user undergoes an additional authorization phase if authorization has been enabled on the switch. Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

3. If TACACS+ authorization is required, the TACACS+ daemon is again contacted, and it returns an ACCEPT or REJECT authorization response. If an ACCEPT response is returned, the response contains data in the form of attributes that direct the EXEC or NETWORK session for that user and the services that the user can access:
  - Telnet, Secure Shell (SSH), rlogin, or privileged EXEC services
  - Connection parameters, including the host or client IP address, access list, and user timeouts

## Method List

A method list defines the sequence and methods to be used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols to be used, thus ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

#### Related Topics

[How to Configure TACACS+](#), on page 1528

[Prerequisites for TACACS+](#), on page 1523

## TACACS+ Configuration Options

You can configure the switch to use a single server or AAA server groups to group existing server hosts for authentication. You can group servers to select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list and contains the list of IP addresses of the selected server hosts.

#### Related Topics

[Identifying the TACACS+ Server Host and Setting the Authentication Key](#), on page 1529

## TACACS+ Login Authentication

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

**Related Topics**

[Configuring TACACS+ Login Authentication](#), on page 1530  
[Prerequisites for TACACS+](#), on page 1523

## TACACS+ Authorization for Privileged EXEC Access and Network Services

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user's profile, which is located either in the local user database or on the security server, to configure the user's session. The user is granted access to a requested service only if the information in the user profile allows it.

**Related Topics**

[Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services](#), on page 1533  
[Prerequisites for TACACS+](#), on page 1523

## TACACS+ Accounting

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.

**Related Topics**

[Starting TACACS+ Accounting](#), on page 1535

## Default TACACS+ Configuration

TACACS+ and AAA are disabled by default.

To prevent a lapse in security, you cannot configure TACACS+ through a network management application. When enabled, TACACS+ can authenticate users accessing the switch through the CLI.

**Note**

---

Although TACACS+ configuration is performed through the CLI, the TACACS+ server authenticates HTTP connections that have been configured with a privilege level of 15.

---

## How to Configure TACACS+

This section describes how to configure your switch to support TACACS+.

## Identifying the TACACS+ Server Host and Setting the Authentication Key

Follow these steps to identify the TACACS+ server host and set the authentication key:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `tacacs server server-name`
4. `address {ipv4 | ipv6} ip address`
5. `exit`
6. `aaa new-model`
7. `aaa group server tacacs+ group-name`
8. `server ip-address`
9. `end`
10. `show running-config`
11. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                                                                                                  | Purpose                                                                                                                                                                                                                                                                     |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <p><code>enable</code></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>                                                                     | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                              |
| Step 2 | <p><code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                | Enters the global configuration mode.                                                                                                                                                                                                                                       |
| Step 3 | <p><code>tacacs server <i>server-name</i></code></p> <p><b>Example:</b></p> <pre>Device(config)# tacacs server yourserver</pre>                    | <p>Identifies the IP host or hosts maintaining a TACACS+ server. Enter this command multiple times to create a list of preferred hosts. The software searches for hosts in the order in which you specify them.</p> <p>For <i>server-name</i>, specify the server name.</p> |
| Step 4 | <p><code>address {ipv4   ipv6} <i>ip address</i></code></p> <p><b>Example:</b></p> <pre>Device(config-server-tacacs)# address ipv4 10.0.1.12</pre> | Configures the IP address for the TACACS server.                                                                                                                                                                                                                            |
| Step 5 | <p><code>exit</code></p> <p><b>Example:</b></p>                                                                                                    | Exits the TACACS server mode and enters the global configuration mode.                                                                                                                                                                                                      |

|                | Command or Action                                                                                                                    | Purpose                                                                                                                                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Device (config-server-tacacs) # <b>exit</b>                                                                                          |                                                                                                                                                                                                                          |
| <b>Step 6</b>  | <b>aaa new-model</b><br><b>Example:</b><br>Device (config) # <b>aaa new-model</b>                                                    | Enables AAA.                                                                                                                                                                                                             |
| <b>Step 7</b>  | <b>aaa group server tacacs+ group-name</b><br><b>Example:</b><br>Device (config) # <b>aaa group server tacacs+ your_server_group</b> | (Optional) Defines the AAA server-group with a group name.<br><br>This command puts the Device in a server group subconfiguration mode.                                                                                  |
| <b>Step 8</b>  | <b>server ip-address</b><br><b>Example:</b><br>Device (config) # <b>server 10.1.1.3</b>                                              | (Optional) Associates a particular TACACS+ server with the defined server group. Repeat this step for each TACACS+ server in the AAA server group.<br><br>Each server in the group must be previously defined in Step 3. |
| <b>Step 9</b>  | <b>end</b><br><b>Example:</b><br>Device (config) # <b>end</b>                                                                        | Returns to privileged EXEC mode.                                                                                                                                                                                         |
| <b>Step 10</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                                                  | Verifies your entries.                                                                                                                                                                                                   |
| <b>Step 11</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                    | (Optional) Saves your entries in the configuration file.                                                                                                                                                                 |

## Configuring TACACS+ Login Authentication

Follow these steps to configure TACACS+ login authentication:

**Before you begin**

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports.

**Note** To secure the for HTTP access by using AAA methods, you must configure the with the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the for HTTP access by using AAA methods.

For more information about the **ip http authentication** command, see the *Cisco IOS Security Command Reference, Release 12.4*.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login {default | list-name} method1 [method2...]**
5. **line [console | tty | vty] line-number [ending-line-number]**
6. **login authentication {default | list-name}**
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

**DETAILED STEPS**

|               | Command or Action                                                                             | Purpose                                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                     | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>             | Enters the global configuration mode.                                                                                                                                                                                       |
| <b>Step 3</b> | <b>aaa new-model</b><br><b>Example:</b><br>Device(config)# <b>aaa new-model</b>               | Enables AAA.                                                                                                                                                                                                                |
| <b>Step 4</b> | <b>aaa authentication login {default   list-name} method1 [method2...]</b><br><b>Example:</b> | Creates a login authentication method list. <ul style="list-style-type: none"> <li>• To create a default list that is used when a named list is <i>not</i> specified in the <b>login authentication</b> command,</li> </ul> |

|                      | Command or Action                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services

You can use the **aaa authorization** global configuration command with the **tacacs+** keyword to set parameters that restrict a user's network access to privileged EXEC mode.

**Note** Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to specify TACACS+ authorization for privileged EXEC access and network services:

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa authorization network tacacs+**
4. **aaa authorization exec tacacs+**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                           | Purpose                                                                                                                                                                                                     |
|---------------|-----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> <b>enable</b>                                                               | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                       | Enters the global configuration mode.                                                                                                                                                                       |
| <b>Step 3</b> | <b>aaa authorization network tacacs+</b><br><b>Example:</b><br><br>Device(config)# <b>aaa authorization network tacacs+</b> | Configures the switch for user TACACS+ authorization for all network-related service requests.                                                                                                              |
| <b>Step 4</b> | <b>aaa authorization exec tacacs+</b><br><b>Example:</b><br><br>Device(config)# <b>aaa authorization exec tacacs+</b>       | Configures the switch for user TACACS+ authorization if the user has privileged EXEC access.<br><br>The <b>exec</b> keyword might return user profile information (such as <b>autocommand</b> information). |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                             | Returns to privileged EXEC mode.                                                                                                                                                                            |
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br><br>Device# <b>show running-config</b>                                     | Verifies your entries.                                                                                                                                                                                      |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b>       | (Optional) Saves your entries in the configuration file.                                                                                                                                                    |

## Starting TACACS+ Accounting

Follow these steps to start TACACS+ Accounting:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa accounting network start-stop tacacs+`
4. `aaa accounting exec start-stop tacacs+`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                                                                                           | Purpose                                                                                                                                         |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                            | Enables privileged EXEC mode. Enter your password if prompted.                                                                                  |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                       | Enters the global configuration mode.                                                                                                           |
| Step 3 | <b>aaa accounting network start-stop tacacs+</b><br><b>Example:</b><br><pre>Device(config)# aaa accounting network start-stop tacacs+</pre> | Enables TACACS+ accounting for all network-related service requests.                                                                            |
| Step 4 | <b>aaa accounting exec start-stop tacacs+</b><br><b>Example:</b><br><pre>Device(config)# aaa accounting exec start-stop tacacs+</pre>       | Enables TACACS+ accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end. |
| Step 5 | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                                             | Returns to privileged EXEC mode.                                                                                                                |

|               | Command or Action                                                                                                       | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                               | Verifies your entries.                                   |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

### What to do next

To establish a session with a router if the AAA server is unreachable, use the **aaa accounting system guarantee-first** command. It guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the **no aaa accounting system guarantee-first** command.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring RADIUS

This section lists the prerequisites for controlling Device access with RADIUS.

General:

- RADIUS and Authentication, Authorization, and Accounting (AAA) must be enabled to use any of the configuration commands in this chapter.
- RADIUS is facilitated through AAA and can be enabled only through AAA commands.
- Use the **aaa new-model** global configuration command to enable AAA.
- Use the **aaa authentication** global configuration command to define method lists for RADIUS authentication.
- Use **line** and **interface** commands to enable the defined method lists to be used.

- At a minimum, you must identify the host or hosts that run the RADIUS server software and define the method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization and accounting.
- You should have access to and should configure a RADIUS server before configuring RADIUS features on your Device.
- The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server Version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.
- To use the Change-of-Authorization (CoA) interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.
- A redundant connection between a switch stack and the RADIUS server is recommended. This is to help ensure that the RADIUS server remains accessible in case one of the connected stack members is removed from the switch stack.

For RADIUS operation:

- Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled.

## Restrictions for Configuring RADIUS

This topic covers restrictions for controlling Device access with RADIUS.

General:

- To prevent a lapse in security, you cannot configure RADIUS through a network management application.

RADIUS is not suitable in the following network security situations:

- Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.
- Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication. RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.
- Networks using a variety of services. RADIUS generally binds a user to one service model.

## RADIUS Overview

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco routers and switches. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information.

Use RADIUS in these network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database. In an IP-based network with multiple vendors' access servers, dial-in users are authenticated through a RADIUS server that has been customized to work with the Kerberos security system.
- Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a *smart card* access control system. In one case, RADIUS has been used with Enigma's security cards to validate users and to grant access to network resources.
- Networks already using RADIUS. You can add a Cisco Device containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See Figure 2: Transitioning from RADIUS to TACACS+ Services below.
- Network in which the user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE 802.1x. For more information about this protocol, see Chapter 11, "Configuring IEEE 802.1x Port-Based Authentication."
- Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.

Figure 91: Transitioning from RADIUS to TACACS+ Services

### Related Topics

[Restrictions for Configuring RADIUS](#), on page 1538

## RADIUS Operation

When a user attempts to log in and authenticate to a Device that is access controlled by a RADIUS server, these events occur:

1. The user is prompted to enter a username and password.
2. The username and encrypted password are sent over the network to the RADIUS server.
3. The user receives one of the following responses from the RADIUS server:
  - ACCEPT—The user is authenticated.
  - REJECT—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
  - CHALLENGE—A challenge requires additional data from the user.
  - CHALLENGE PASSWORD—A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. The additional data included with the ACCEPT or REJECT packets includes these items:

- Telnet, SSH, rlogin, or privileged EXEC services
- Connection parameters, including the host or client IP address, access list, and user timeouts

## RADIUS Change of Authorization

The RADIUS Change of Authorization (CoA) provides a mechanism to change the attributes of an authentication, authorization, and accounting (AAA) session after it is authenticated. When a policy changes for a user or user group in AAA, administrators can send RADIUS CoA packets from the AAA server such as a Cisco Secure Access Control Server (ACS) to reinitialize authentication and apply the new policy. This section provides an overview of the RADIUS interface including available primitives and how they are used during a CoA.

- Change-of-Authorization Requests
- CoA Request Response Code
- CoA Request Commands
- Session Reauthentication
- Stacking Guidelines for Session Termination

A standard RADIUS interface is typically used in a pulled model where the request originates from a network attached device and the response come from the queried servers. Catalyst support the RADIUS CoA extensions defined in RFC 5176 that are typically used in a pushed model and allow for the dynamic reconfiguring of sessions from external AAA or policy servers.

The supports these per-session CoA requests:

- Session reauthentication
- Session termination
- Session termination with port shutdown
- Session termination with port bounce

This feature is integrated with Cisco Secure Access Control Server (ACS) 5.1.

The RADIUS interface is enabled by default on Catalyst . However, some basic configuration is required for the following attributes:

- Security and Password—refer to the “Preventing Unauthorized Access to Your Switch” section in this guide.
- Accounting—refer to the “Starting RADIUS Accounting” section in the Configuring Switch-Based Authentication chapter in this guide.

Cisco IOS software supports the RADIUS CoA extensions defined in RFC 5176 that are typically used in a push model to allow the dynamic reconfiguring of sessions from external AAA or policy servers. Per-session CoA requests are supported for session identification, session termination, host reauthentication, port shutdown, and port bounce. This model comprises one request (CoA-Request) and two possible response codes:

- CoA acknowledgement (ACK) [CoA-ACK]
- CoA nonacknowledgement (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a AAA or policy server) and directed to the device that acts as a listener.

The table below shows the RADIUS CoA commands and vendor-specific attributes (VSAs) supported by Identity-Based Networking Services. All CoA commands must include the session identifier between the device and the CoA client.

**Table 122: RADIUS CoA Commands Supported by Identity-Based Networking Services**

| CoA Command            | Cisco VSA                                                                                                                                                                                                                        |

## Change-of-Authorization Requests

Change of Authorization (CoA) requests, as described in RFC 5176, are used in a push model to allow for session identification, host reauthentication, and session termination. The model is comprised of one request (CoA-Request) and two possible response codes:

- CoA acknowledgment (ACK) [CoA-ACK]
- CoA non-acknowledgment (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a RADIUS or policy server) and directed to the switch that acts as a listener.

### RFC 5176 Compliance

The Disconnect Request message, which is also referred to as Packet of Disconnect (POD), is supported by the switch for session termination.

This table shows the IETF attributes are supported for this feature.

**Table 123: Supported IETF Attributes**

| Attribute Number | Attribute Name        |
|------------------|-----------------------|
| 24               | State                 |
| 31               | Calling-Station-ID    |
| 44               | Acct-Session-ID       |
| 80               | Message-Authenticator |
| 101              | Error-Cause           |

This table shows the possible values for the Error-Cause attribute.

**Table 124: Error-Cause Values**

| Value | Explanation                            |
|-------|----------------------------------------|
| 201   | Residual Session Context Removed       |
| 202   | Invalid EAP Packet (Ignored)           |
| 401   | Unsupported Attribute                  |
| 402   | Missing Attribute                      |
| 403   | NAS Identification Mismatch            |
| 404   | Invalid Request                        |
| 405   | Unsupported Service                    |
| 406   | Unsupported Extension                  |
| 407   | Invalid Attribute Value                |
| 501   | Administratively Prohibited            |
| 502   | Request Not Routable (Proxy)           |
| 503   | Session Context Not Found              |
| 504   | Session Context Not Removable          |
| 505   | Other Proxy Processing Error           |
| 506   | Resources Unavailable                  |
| 507   | Request Initiated                      |
| 508   | Multiple Session Selection Unsupported |

## CoA Request Response Code

The CoA Request response code can be used to convey a command to the switch.

The packet format for a CoA Request Response code as defined in RFC 5176 consists of the following fields: Code, Identifier, Length, Authenticator, and Attributes in the Type:Length:Value (TLV) format. The Attributes field is used to carry Cisco vendor-specific attributes (VSAs).

### Related Topics

[CoA Request Commands](#), on page 1545

### Session Identification

For disconnect and CoA requests targeted at a particular session, the switch locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31 which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
  - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  - Framed-IPv6-Address
- Plain IP Address (IETF attribute #8)

Unless all session identification attributes included in the CoA message match the session, the switch returns a Disconnect-NAK or CoA-NAK with the “Invalid Attribute Value” error-code attribute.

If more than one session identification attribute is included in the message, all the attributes must match the session or the switch returns a Disconnect- negative acknowledgment (NAK) or CoA-NAK with the error code “Invalid Attribute Value.”

The packet format for a CoA Request code as defined in RFC 5176 consists of the fields: Code, Identifier, Length, Authenticator, and Attributes in Type:Length:Value (TLV) format.

```

 0 1 2 3
 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
 +-----+-----+-----+-----+-----+-----+-----+-----+
 | Code | Identifier | Length |
 +-----+-----+-----+-----+-----+-----+-----+-----+
 | Authenticator |
 | |
 | |
 +-----+-----+-----+-----+-----+-----+-----+-----+
 | Attributes ...
 +-----+-----+-----+-----+-----+-----+-----+-----+

```

The attributes field is used to carry Cisco vendor-specific attributes (VSAs).

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.

**CoA ACK Response Code**

If the authorization state is changed successfully, a positive acknowledgment (ACK) is sent. The attributes returned within CoA ACK will vary based on the CoA Request and are discussed in individual CoA Commands.

**CoA NAK Response Code**

A negative acknowledgment (NAK) indicates a failure to change the authorization state and can include attributes that indicate the reason for the failure. Use **show** commands to verify a successful CoA.

**CoA Request Commands**

*Table 125: CoA Commands Supported on the*

| Command             | Cisco VSA                                                          |
|---------------------|--------------------------------------------------------------------|
| <sup>8</sup>        |                                                                    |
| Reauthenticate host | Cisco:Avpair="subscriber:command=reauthenticate"                   |
| Terminate session   | This is a standard disconnect request that does not require a VSA. |
| Bounce host port    | Cisco:Avpair="subscriber:command=bounce-host-port"                 |
| Disable host port   | Cisco:Avpair="subscriber:command=disable-host-port"                |

<sup>8</sup> All CoA commands must include the session identifier between the `and` and the CoA client.

**Session Reauthentication**

The AAA server typically generates a session reauthentication request when a host with an unknown identity or posture joins the network and is associated with a restricted access authorization profile (such as a guest VLAN). A reauthentication request allows the host to be placed in the appropriate authorization group when its credentials are known.

To initiate session authentication, the AAA server sends a standard CoA-Request message which contains a Cisco VSA in this form: *Cisco:Avpair="subscriber:command=reauthenticate"* and one or more session identification attributes.

The current session state determines the switch response to the message. If the session is currently authenticated by IEEE 802.1x, the switch responds by sending an EAPoL (Extensible Authentication Protocol over Lan) -RequestId message to the server.

If the session is currently authenticated by MAC authentication bypass (MAB), the switch sends an access-request to the server, passing the same identity attributes used for the initial successful authentication.

If session authentication is in progress when the switch receives the command, the switch terminates the process, and restarts the authentication sequence, starting with the method configured to be attempted first.

If the session is not yet authorized, or is authorized via guest VLAN, or critical VLAN, or similar policies, the reauthentication message restarts the access control methods, beginning with the method configured to be attempted first. The current authorization of the session is maintained until the reauthentication leads to a different authorization result.

### Session Reauthentication in a Switch Stack

When a switch stack receives a session reauthentication message:

- It checkpoints the need for a re-authentication before returning an acknowledgment (ACK).
- It initiates reauthentication for the appropriate session.
- If authentication completes with either success or failure, the signal that triggered the reauthentication is removed from the stack member.
- If the stack master fails before authentication completes, reauthentication is initiated after stack master switch-over based on the original command (which is subsequently removed).
- If the stack master fails before sending an ACK, the new stack master treats the re-transmitted command as a new command.

### Session Termination

There are three types of CoA requests that can trigger session termination. A CoA Disconnect-Request terminates the session, without disabling the host port. This command causes re-initialization of the authenticator state machine for the specified host, but does not restrict that host access to the network.

To restrict a host's access to the network, use a CoA Request with the `Cisco:Avpair="subscriber:command=disable-host-port"` VSA. This command is useful when a host is known to be causing problems on the network, and you need to immediately block network access for the host. When you want to restore network access on the port, re-enable it using a non-RADIUS mechanism.

When a device with no supplicant, such as a printer, needs to acquire a new IP address (for example, after a VLAN change), terminate the session on the host port with port-bounce (temporarily disable and then re-enable the port).

### CoA Disconnect-Request

This command is a standard Disconnect-Request. If the session cannot be located, the switch returns a Disconnect-NAK message with the "Session Context Not Found" error-code attribute. If the session is located, the switch terminates the session. After the session has been completely removed, the switch returns a Disconnect-ACK.

If the switch fails-over to a standby switch before returning a Disconnect-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the session is not found following re-sending, a Disconnect-ACK is sent with the "Session Context Not Found" error-code attribute.

[Session Identification](#), on page 1544

### CoA Request: Disable Host Port

The RADIUS server CoA disable port command administratively shuts down the authentication port that is hosting a session, resulting in session termination. This command is useful when a host is known to cause problems on the network and network access needs to be immediately blocked for the host. To restore network

access on the port, reenable it using a non-RADIUS mechanism. This command is carried in a standard CoA-Request message that has this new vendor-specific attribute (VSA):

```
Cisco:Avpair="subscriber:command=disable-host-port"
```

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the “Session Identification” section. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port and returns a CoA-ACK message.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is restarted on the new active switch.

**Note** A Disconnect-Request failure following command re-sending could be the result of either a successful session termination before change-over (if the Disconnect-ACK was not sent) or a session termination by other means (for example, a link failure) that occurred after the original command was issued and before the standby switch became active.

#### Related Topics

[Session Identification](#), on page 1544

### CoA Request: Bounce-Port

A RADIUS server CoA bounce port sent from a RADIUS server can cause a link flap on an authentication port, which triggers DHCP renegotiation from one or more hosts connected to this port. This incident can occur when there is a VLAN change and the endpoint is a device (such as a printer) that does not have a mechanism to detect a change on this authentication port. The CoA bounce port is carried in a standard CoA-Request message that contains the following VSA:

```
Cisco:Avpair="subscriber:command=bounce-host-port"
```

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port for a period of 10 seconds, re-enables it (port-bounce), and returns a CoA-ACK.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is re-started on the new active switch.

## Stacking Guidelines for Session Termination

No special handling is required for CoA Disconnect-Request messages in a switch stack.

### Stacking Guidelines for CoA-Request Bounce-Port

Because the **bounce-port** command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the stack master receives a valid **bounce-port** command, it checkpoints the following information before returning a CoA-ACK message:

- the need for a port-bounce
- the port-id (found in the local session context)

The switch initiates a port-bounce (disables the port for 10 seconds, then re-enables it).

If the port-bounce is successful, the signal that triggered the port-bounce is removed from the standby stack master.

If the stack master fails before the port-bounce completes, a port-bounce is initiated after stack master change-over based on the original command (which is subsequently removed).

If the stack master fails before sending a CoA-ACK message, the new stack master treats the re-sent command as a new command.

### Stacking Guidelines for CoA-Request Disable-Port

Because the **disable-port** command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the stack master receives a valid **disable-port** command, it verifies this information before returning a CoA-ACK message:

- the need for a port-disable
- the port-id (found in the local session context)

The switch attempts to disable the port.

If the port-disable operation is successful, the signal that triggered the port-disable is removed from the standby stack master.

If the stack master fails before the port-disable operation completes, the port is disabled after stack master change-over based on the original command (which is subsequently removed).

If the stack master fails before sending a CoA-ACK message, the new stack master treats the re-sent command as a new command.

## Default RADIUS Configuration

RADIUS and AAA are disabled by default.

To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the switch through the CLI.

## RADIUS Server Host

Switch-to-RADIUS-server communication involves several components:

- Hostname or IP address
- Authentication destination port
- Accounting destination port

- Key string
- Timeout period
- Retransmission value

You identify RADIUS security servers by their hostname or IP address, hostname and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the %RADIUS-4-RADIUS\_DEAD message appears, and then the switch tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the switch.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings.

[Defining AAA Server Groups](#), on page 1567

[Configuring Settings for All RADIUS Servers](#), on page 1572

[Configuring RADIUS Login Authentication](#), on page 1565

## RADIUS Login Authentication

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list. The default method list is automatically applied to all ports except those that have a named method list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

#### Related Topics

[Configuring RADIUS Login Authentication](#), on page 1565

## AAA Server Groups

You can configure the switch to use AAA server groups to group existing server hosts for authentication. You select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier (the combination of the IP address and UDP port number), allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to different UDP ports on a server at the same IP address. If you configure two different host entries on the same RADIUS server for the same service, (for example, accounting), the second configured host entry acts as a fail-over backup to the first one. If the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order in which they are configured.)

### Related Topics

[Defining AAA Server Groups](#), on page 1567

## AAA Authorization

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user's profile, which is in the local user database or on the security server, to configure the user's session. The user is granted access to a requested service only if the information in the user profile allows it.

### Related Topics

[Configuring RADIUS Authorization for User Privileged Access and Network Services](#), on page 1569

## RADIUS Accounting

The AAA accounting feature tracks the services that users are using and the amount of network resources that they are consuming. When you enable AAA accounting, the switch reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. You can then analyze the data for network management, client billing, or auditing.

[Starting RADIUS Accounting](#), on page 1570

## Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the switch and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using the format recommended in the specification. Cisco's vendor-ID is 9, and the supported option has vendor-type 1, which is named *cisco-avpair*. The value is a string with this format:

```
protocol : attribute sep value *
```

*Protocol* is a value of the Cisco protocol attribute for a particular type of authorization. *Attribute* and *value* are an appropriate attributevalue (AV) pair defined in the Cisco TACACS+ specification, and *sep* is = for mandatory attributes and is \* for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.

For example, the following AV pair causes Cisco's "multiple named IP address pools" feature to be activated during IP authorization (during PPP's Internet Protocol Control Protocol (IPCP) address assignment):

```
cisco-avpair= "ip:addr-pool=first"
```

If you insert an "\*", the AV pair "ip:addr-pool=first" becomes optional. Note that any AV pair can be made optional:

```
cisco-avpair= "ip:addr-pool*first"
```

The following example shows how to cause a user logging in from a network access server to have immediate access to EXEC commands:

```
cisco-avpair= "shell:priv-lvl=15"
```

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, "Remote Authentication Dial-In User Service (RADIUS)."

Attribute 26 contains the following three elements:

- Type
- Length
- String (also known as data)
  - Vendor-Id
  - Vendor-Type
  - Vendor-Length
  - Vendor-Data

The figure below shows the packet format for a VSA encapsulated "behind" attribute 26.

**Figure 92: VSA Encapsulated Behind Attribute 26**

**Note** It is up to the vendor to specify the format of their VSA. The Attribute-Specific field (also known as Vendor-Data) is dependent on the vendor's definition of that attribute.

The table below describes significant fields listed in the Vendor-Specific RADIUS IETF Attributes table (second table below), which lists supported vendor-specific RADIUS attributes (IETF attribute 26).

Table 126: Vendor-Specific Attributes Table Field Descriptions

| Field                         | Description                                                                                                                                                    |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number                        | All attributes listed in the following table are extensions of IETF attribute 26.                                                                              |
| Vendor-Specific Command Codes | A defined code used to identify a particular vendor. Code 9 defines Cisco VSAs, 311 defines Microsoft VSAs, and 529 defines Ascend VSAs.                       |
| Sub-Type Number               | The attribute ID number. This number is much like the ID numbers of IETF attributes, except it is a “second layer” ID number encapsulated behind attribute 26. |
| Attribute                     | The ASCII string name of the attribute.                                                                                                                        |
| Description                   | Description of the attribute.                                                                                                                                  |

Table 127: Vendor-Specific RADIUS IETF Attributes

| Number             | Vendor-Specific Company Code | Sub-Type Number | Attribute                 | Description                                                                                                                                                                                                              |
|--------------------|------------------------------|-----------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MS-CHAP Attributes |                              |                 |                           |                                                                                                                                                                                                                          |
| 26                 | 311                          | 1               | MSCHAP-Response           | Contains the response value provided by a PPP MS-CHAP user in response to the challenge. It is only used in Access-Request packets. This attribute is identical to the PPP CHAP Identifier. ( <a href="#">RFC 2548</a> ) |
| 26                 | 311                          | 11              | MSCHAP-Challenge          | Contains the challenge sent by a network access server to an MS-CHAP user. It can be used in both Access-Request and Access-Challenge packets. ( RFC 2548 )                                                              |
| VPDN Attributes    |                              |                 |                           |                                                                                                                                                                                                                          |
| 26                 | 9                            | 1               | l2tp-cm-local-window-size | Specifies the maximum receive window size for L2TP control messages. This value is advertised to the peer during tunnel establishment.                                                                                   |

| Number | Vendor-Specific Company Code | Sub-Type Number | Attribute              | Description                                                                                                                                                                                                        |
|--------|------------------------------|-----------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 26     | 9                            | 1               | l2tp-drop-out-of-order | Respects sequence numbers on data packets by dropping those that are received out of order. This does not ensure that sequence numbers will be sent on data packets, just how to handle them if they are received. |
| 26     | 9                            | 1               | l2tp-hello-interval    | Specifies the number of seconds for the hello keepalive interval. Hello packets are sent when no data has been sent on a tunnel for the number of seconds configured here.                                         |
| 26     | 9                            | 1               | l2tp-hidden-avp        | When enabled, sensitive AVPs in L2TP control messages are scrambled or hidden.                                                                                                                                     |
| 26     | 9                            | 1               | l2tp-nosession-timeout | Specifies the number of seconds that a tunnel will stay active with no sessions before timing out and shutting down.                                                                                               |
| 26     | 9                            | 1               | tunnel-tos-reflect     | Copies the IP ToS field from the IP header of each payload packet to the IP header of the tunnel packet for packets entering the tunnel at the LNS.                                                                |
| 26     | 9                            | 1               | l2tp-tunnel-authen     | If this attribute is set, it performs L2TP tunnel authentication.                                                                                                                                                  |
| 26     | 9                            | 1               | l2tp-tunnel-password   | Shared secret used for L2TP tunnel authentication and AVP hiding.                                                                                                                                                  |

| Number                           | Vendor-Specific Company Code | Sub-Type Number | Attribute             | Description                                                                                                                                                                                                                                                                                                  |
|----------------------------------|------------------------------|-----------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 26                               | 9                            | 1               | l2tp-udp-checksum     | This is an authorization attribute and defines whether L2TP should perform UDP checksums for data packets. Valid values are “yes” and “no.” The default is no.                                                                                                                                               |
| Store and Forward Fax Attributes |                              |                 |                       |                                                                                                                                                                                                                                                                                                              |
| 26                               | 9                            | 3               | Fax-Account-Id-Origin | Indicates the account ID origin as defined by system administrator for the <b>mmoip aaa receive-id</b> or the <b>mmoip aaa send-id</b> commands.                                                                                                                                                             |
| 26                               | 9                            | 4               | Fax-Msg-Id=           | Indicates a unique fax message identification number assigned by Store and Forward Fax.                                                                                                                                                                                                                      |
| 26                               | 9                            | 5               | Fax-Pages             | Indicates the number of pages transmitted or received during this fax session. This page count includes cover pages.                                                                                                                                                                                         |
| 26                               | 9                            | 6               | Fax-Coverpage-Flag    | Indicates whether or not a cover page was generated by the off-ramp gateway for this fax session. True indicates that a cover page was generated; false means that a cover page was not generated.                                                                                                           |
| 26                               | 9                            | 7               | Fax-Modem-Time        | Indicates the amount of time in seconds the modem sent fax data (x) and the amount of time in seconds of the total fax session (y), which includes both fax-mail and PSTN time, in the form x/y. For example, 10/15 means that the transfer time took 10 seconds, and the total fax session took 15 seconds. |

| Number | Vendor-Specific Company Code | Sub-Type Number | Attribute              | Description                                                                                                                                                         |
|--------|------------------------------|-----------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 26     | 9                            | 8               | Fax-Connect-Speed      | Indicates the modem speed at which this fax-mail was initially transmitted or received. Possible values are 1200, 4800, 9600, and 14400.                            |
| 26     | 9                            | 9               | Fax-Recipient-Count    | Indicates the number of recipients for this fax transmission. Until e-mail servers support Session mode, the number should be 1.                                    |
| 26     | 9                            | 10              | Fax-Process-Abort-Flag | Indicates that the fax session was aborted or successful. True means that the session was aborted; false means that the session was successful.                     |
| 26     | 9                            | 11              | Fax-Dsn-Address        | Indicates the address to which DSNs will be sent.                                                                                                                   |
| 26     | 9                            | 12              | Fax-Dsn-Flag           | Indicates whether or not DSN has been enabled. True indicates that DSN has been enabled; false means that DSN has not been enabled.                                 |
| 26     | 9                            | 13              | Fax-Mdn-Address        | Indicates the address to which MDNs will be sent.                                                                                                                   |
| 26     | 9                            | 14              | Fax-Mdn-Flag           | Indicates whether or not message delivery notification (MDN) has been enabled. True indicates that MDN had been enabled; false means that MDN had not been enabled. |
| 26     | 9                            | 15              | Fax-Auth-Status        | Indicates whether or not authentication for this fax session was successful. Possible values for this field are success, failed, bypassed, or unknown.              |

| Number          | Vendor-Specific Company Code | Sub-Type Number | Attribute                               | Description                                                                                                                                                                                                                                                                                   |
|-----------------|------------------------------|-----------------|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 26              | 9                            | 16              | Email-Server-Address                    | Indicates the IP address of the e-mail server handling the on-ramp fax-mail message.                                                                                                                                                                                                          |
| 26              | 9                            | 17              | Email-Server-Ack-Flag                   | Indicates that the on-ramp gateway has received a positive acknowledgment from the e-mail server accepting the fax-mail message.                                                                                                                                                              |
| 26              | 9                            | 18              | Gateway-Id                              | Indicates the name of the gateway that processed the fax session. The name appears in the following format:<br>hostname.domain-name.                                                                                                                                                          |
| 26              | 9                            | 19              | Call-Type                               | Describes the type of fax activity: fax receive or fax send.                                                                                                                                                                                                                                  |
| 26              | 9                            | 20              | Port-Used                               | Indicates the slot/port number of the Cisco AS5300 used to either transmit or receive this fax-mail.                                                                                                                                                                                          |
| 26              | 9                            | 21              | Abort-Cause                             | If the fax session aborts, indicates the system component that signaled the abort. Examples of system components that could trigger an abort are FAP (Fax Application Process), TIFF (the TIFF reader or the TIFF writer), fax-mail client, fax-mail server, ESMTTP client, or ESMTTP server. |
| H323 Attributes |                              |                 |                                         |                                                                                                                                                                                                                                                                                               |

| 26                             | 9                            | 1               | dial-number                                 | Defines the number to dial.                                                                                                                 |

| Number | Vendor-Specific Company Code | Sub-Type Number | Attribute | Description                                                                                                                              |
|--------|------------------------------|-----------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------|
| 26     | 9                            | 1               | force-56  | Determines whether the network access server uses only the 56 K portion of a channel, even when all 64 K appear to be available.         |
| 26     | 9                            | 1               | map-class | Allows the user profile to reference information configured in a map class of the same name on the network access server that dials out. |
| 26     | 9                            | 1               | send-auth | Defines the protocol to use (PAP or CHAP) for username-password authentication following CLID authentication.                            |

| Number | Vendor-Specific Company Code | Sub-Type Number | Attribute | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|------------------------------|-----------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 26     | 9                            | 1               | send-name | <p>PPP name authentication. To apply for PAP, do not configure the <b>ppp pap sent-name password</b> command on the interface. For PAP, “preauth:send-name” and “preauth:send-secret” will be used as the PAP username and PAP password for outbound authentication. For CHAP, “preauth:send-name” will be used not only for outbound authentication, but also for inbound authentication. For a CHAP inbound case, the NAS will use the name defined in “preauth:send-name” in the challenge packet to the caller box.</p> <p><b>Note</b> The send-name attribute has changed over time: Initially, it performed the functions now provided by both the send-name and remote-name attributes. Because the remote-name attribute has been added, the send-name attribute is restricted to its current behavior.</p> |

| Number                   | Vendor-Specific Company Code | Sub-Type Number | Attribute   | Description                                                                                                                                                                                                                                                                                                       |
|--------------------------|------------------------------|-----------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 26                       | 9                            | 1               | send-secret | PPP password authentication. The vendor-specific attributes (VSAs) "preauth:send-name" and "preauth:send-secret" will be used as the PAP username and PAP password for outbound authentication. For a CHAP outbound case, both "preauth:send-name" and "preauth:send-secret" will be used in the response packet. |
| 26                       | 9                            | 1               | remote-name | Provides the name of the remote host for use in large-scale dial-out. Dialer checks that the large-scale dial-out remote name matches the authenticated name, to protect against accidental user RADIUS misconfiguration. (For example, dialing a valid phone number but connecting to the wrong device.)         |

## Vendor-Proprietary RADIUS Server Communication

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the switch and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS software supports a subset of vendor-proprietary RADIUS attributes.

As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the switch. You specify the RADIUS host and secret text string by using the **radius-server** global configuration commands.

## How to Configure RADIUS

### Identifying the RADIUS Server Host

To apply these settings globally to all RADIUS servers communicating with the Device, use the three unique global configuration commands: **radius-server timeout**, **radius-server retransmit**, and **key string**.

You can configure the Device to use AAA server groups to group existing server hosts for authentication. For more information, see Related Topics below.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the Device and the key string to be shared by both the server and the Device. For more information, see the RADIUS server documentation.

Follow these steps to configure per-server RADIUS server communication.

### Before you begin

If you configure both global and per-server functions (timeout, retransmission, and key commands) on the device, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands. For information on configuring these settings on all RADIUS servers, see Related Topics below.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius server** *server name*
4. **address** {*ipv4* | *ipv6*} *ip address* { **auth-port** *port number* | **acct-port** *port number*}
5. **key** *string*
6. **retransmit** *value*
7. **timeout** *seconds*
8. **exit**
9. **end**
10. **show running-config**
11. **copy running-config startup-config**

### DETAILED STEPS

|        | Command or Action                                                                                                                            | Purpose                                                        |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                    | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                            | Enters the global configuration mode.                          |
| Step 3 | <b>radius server</b> <i>server name</i><br><b>Example:</b><br>Device(config)# <b>radius server</b> <i>rsim</i>                               |                                                                |
| Step 4 | <b>address</b> { <i>ipv4</i>   <i>ipv6</i> } <i>ip address</i> { <b>auth-port</b> <i>port number</i>   <b>acct-port</b> <i>port number</i> } | (Optional) Specifies the RADIUS server parameters.             |

|                | Command or Action                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <p><b>Example:</b></p> <pre>Device(config-radius-server)# address ipv4 124.2.2.12 auth-port 1612</pre>       | <p>For <b>auth-port</b> <i>port-number</i>, specify the UDP destination port for authentication requests. The default is 1645. The range is 0 to 65536.</p> <p>For <b>acct-port</b> <i>port-number</i>, specify the UDP destination port for authentication requests. The default is 1646.</p>                                                                                                                                                                                                                                                                         |
| <b>Step 5</b>  | <p><b>key string</b></p> <p><b>Example:</b></p> <pre>Device(config-radius-server)# key rad123</pre>          | <p>(Optional) For <b>key string</b>, specify the authentication and encryption key used between the Device and the RADIUS daemon running on the RADIUS server.</p> <p><b>Note</b> The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the <b>radius server</b> command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</p> |
| <b>Step 6</b>  | <p><b>retransmit value</b></p> <p><b>Example:</b></p> <pre>Device(config-radius-server)# retransmit 10</pre> | <p>(Optional) Specifies the number of times a RADIUS request is resent when the server is not responding or responding slowly. The range is 1 to 100. This setting overrides the <b>radius-server retransmit</b> global configuration command setting.</p>                                                                                                                                                                                                                                                                                                             |
| <b>Step 7</b>  | <p><b>timeout seconds</b></p> <p><b>Example:</b></p> <pre>Device(config-radius-server)# timeout 60</pre>     | <p>(Optional) Specifies the time interval that the Device waits for the RADIUS server to reply before sending a request again. The range is 1 to 1000. This setting overrides the <b>radius-server timeout</b> global configuration command setting.</p>                                                                                                                                                                                                                                                                                                               |
| <b>Step 8</b>  | <p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-server-tacacs)# exit</pre>                      | <p>Exits the RADIUS server mode and enters the global configuration mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 9</b>  | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                      | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 10</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>              | <p>Verifies your entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|         | Command or Action                                                                                                       | Purpose                                                  |
|---------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 11 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring RADIUS Login Authentication

Follow these steps to configure RADIUS login authentication:

### Before you begin

To secure the device for HTTP access by using AAA methods, you must configure the device with the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the device for HTTP access by using AAA methods.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login** {default | list-name} method1 [method2...]
5. **line** [console | tty | vty] line-number [ending-line-number]
6. **login authentication** {default | list-name}
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

### DETAILED STEPS

|        | Command or Action                                                                       | Purpose                                                        |
|--------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                          |
| Step 3 | <b>aaa new-model</b><br><b>Example:</b>                                                 | Enables AAA.                                                   |

## Defining AAA Server Groups

You use the **server** group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional **auth-port** and **acct-port** keywords.

Follow these steps to define AAA server groups:

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **radius server** *name*
4. **address** {**ipv4** | **ipv6**} {*ip-address* | *hostname*} **auth-port** *port-number* **acct-port** *port-number*
5. **end** {{**0** | **7**} *string*}*string*

6. `end`
7. `show running-config`
8. `copy running-config startup-config`

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                     | Purpose                                                                                                                                                                                                |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                                                                                                                                       | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                                                                               | Enters the global configuration mode.                                                                                                                                                                  |
| <b>Step 3</b> | <b>radius server <i>name</i></b><br><b>Example:</b><br>Device(config)# <code>radius server ISE</code>                                                                                                                 | Specifies the name of the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode.<br><br>The device also supports RADIUS for IPv6. |
| <b>Step 4</b> | <b>address {ipv4   ipv6} {ip-address   hostname} auth-port port-number acct-port port-number</b><br><b>Example:</b><br>Device(config-radius-server)# <code>address ipv4 10.1.1.1 auth-port 1645 acct-port 1646</code> | Configures the IPv4 address for the RADIUS server accounting and authentication parameters.                                                                                                            |
| <b>Step 5</b> | <b>end {{0   7} string}string</b><br><b>Example:</b><br>Device(config-radius-server)# <code>key cisco123</code>                                                                                                       | Specifies the authentication and encryption key for all RADIUS communications between the device and the RADIUS server.                                                                                |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config-radius-server)# <code>end</code>                                                                                                                                       | Exits RADIUS server configuration mode and returns to privileged EXEC mode.                                                                                                                            |
| <b>Step 7</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                                                                                                                             | Verifies your entries.                                                                                                                                                                                 |

|        | Command or Action                                                                                                       | Purpose                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 8 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring RADIUS Authorization for User Privileged Access and Network Services

**Note** Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to configure RADIUS authorization for user privileged access and network services:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa authorization network radius`
4. `aaa authorization exec radius`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                                       | Purpose                                                        |
|--------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                      | Purpose                                                                                                                                                                                                    |
|---------------|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <b>aaa authorization network radius</b><br><b>Example:</b><br>Device(config) # <b>aaa authorization network radius</b> | Configures the device for user RADIUS authorization for all network-related service requests.                                                                                                              |
| <b>Step 4</b> | <b>aaa authorization exec radius</b><br><b>Example:</b><br>Device(config) # <b>aaa authorization exec radius</b>       | Configures the device for user RADIUS authorization if the user has privileged EXEC access.<br><br>The <b>exec</b> keyword might return user profile information (such as <b>autocommand</b> information). |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config) # <b>end</b>                                                           | Returns to privileged EXEC mode.                                                                                                                                                                           |
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                                    | Verifies your entries.                                                                                                                                                                                     |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>      | (Optional) Saves your entries in the configuration file.                                                                                                                                                   |

### What to do next

You can use the **aaa authorization** global configuration command with the **radius** keyword to set parameters that restrict a user's network access to privileged EXEC mode.

The **aaa authorization exec radius local** command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.

## Starting RADIUS Accounting

Follow these steps to start RADIUS accounting:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa accounting network start-stop radius`
4. `aaa accounting exec start-stop radius`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

**DETAILED STEPS**

|               | <b>Command or Action</b>                                                                                                                  | <b>Purpose</b>                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                          | Enables privileged EXEC mode. Enter your password if prompted.                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                     | Enters the global configuration mode.                                                                                                          |
| <b>Step 3</b> | <b>aaa accounting network start-stop radius</b><br><b>Example:</b><br><pre>Device(config)# aaa accounting network start-stop radius</pre> | Enables RADIUS accounting for all network-related service requests.                                                                            |
| <b>Step 4</b> | <b>aaa accounting exec start-stop radius</b><br><b>Example:</b><br><pre>Device(config)# aaa accounting exec start-stop radius</pre>       | Enables RADIUS accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br><pre>Device(config)# end</pre>                                                                           | Returns to privileged EXEC mode.                                                                                                               |
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br><pre>Device# show running-config</pre>                                                   | Verifies your entries.                                                                                                                         |

|               | Command or Action                                                                                                       | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

### What to do next

To establishing a session with a router if the AAA server is unreachable, use the **aaa accounting system guarantee-first** command. This command guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the **no aaa accounting system guarantee-first** command.

## Configuring Settings for All RADIUS Servers

Beginning in privileged EXEC mode, follow these steps to configure settings for all RADIUS servers:

### SUMMARY STEPS

1. **configure terminal**
2. **radius-server key *string***
3. **radius-server retransmit *retries***
4. **radius-server timeout *seconds***
5. **radius-server deadtime *minutes***
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                       | Purpose                                                                                 |
|---------------|-----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                                                   |
| <b>Step 2</b> | <b>radius-server key <i>string</i></b><br><b>Example:</b>                               | Specifies the shared secret text string used between the switch and all RADIUS servers. |

|               | Command or Action                                                                                                                  | Purpose                                                                                                                                                                                                                                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <pre>Device(config)# radius-server key your_server_key</pre><br><pre>Device(config)# key your_server_key</pre>                     | <p><b>Note</b> The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</p> |
| <b>Step 3</b> | <p><b>radius-server retransmit</b> <i>retries</i></p> <p><b>Example:</b></p> <pre>Device(config)# radius-server retransmit 5</pre> | Specifies the number of times the switch sends each RADIUS request to the server before giving up. The default is 3; the range 1 to 1000.                                                                                                                                                                            |
| <b>Step 4</b> | <p><b>radius-server timeout</b> <i>seconds</i></p> <p><b>Example:</b></p> <pre>Device(config)# radius-server timeout 3</pre>       | Specifies the number of seconds a switch waits for a reply to a RADIUS request before resending the request. The default is 5 seconds; the range is 1 to 1000.                                                                                                                                                       |
| <b>Step 5</b> | <p><b>radius-server deadtime</b> <i>minutes</i></p> <p><b>Example:</b></p> <pre>Device(config)# radius-server deadtime 0</pre>     | When a RADIUS server is not responding to authentication requests, this command specifies a time to stop the request on that server. This avoids the wait for the request to timeout before trying the next configured server. The default is 0; the range is 1 to 1440 minutes.                                     |
| <b>Step 6</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>                                    | Verifies your entries.                                                                                                                                                                                                                                                                                               |
| <b>Step 8</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>      | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                             |

## Configuring the Device to Use Vendor-Specific RADIUS Attributes

Follow these steps to configure the device to use vendor-specific RADIUS attributes:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **radius-server vsa send [accounting | authentication]**
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                          | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 3</b> | <b>radius-server vsa send [accounting   authentication]</b><br><b>Example:</b><br>Device(config)# <b>radius-server vsa send accounting</b> | Enables the device to recognize and use VSAs as defined by RADIUS IETF attribute 26. <ul style="list-style-type: none"> <li>• (Optional) Use the <b>accounting</b> keyword to limit the set of recognized vendor-specific attributes to only accounting attributes.</li> <li>• (Optional) Use the <b>authentication</b> keyword to limit the set of recognized vendor-specific attributes to only authentication attributes.</li> </ul> If you enter this command without keywords, both accounting and authentication vendor-specific attributes are used. |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|        | Command or Action                                                                                                       | Purpose                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 5 | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                               | Verifies your entries.                                   |
| Step 6 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

## Configuring the Device for Vendor-Proprietary RADIUS Server Communication

Follow these steps to configure the device to use vendor-proprietary RADIUS server communication:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `radius server server name`
4. `address { ipv4 | ipv6 } ip address`
5. `non-standard`
6. `key string`
7. `exit`
8. `end`
9. `show running-config`
10. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                                       | Purpose                                                        |
|--------|-----------------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                         | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code> | Enters the global configuration mode.                          |

|                | Command or Action                                                                                                                                   | Purpose                                                                                                                                                                                                      |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b>  | <b>radius server</b> <i>server name</i><br><b>Example:</b><br>Device(config)# <b>radius server rsim</b>                                             | Specifies the RADIUS server.                                                                                                                                                                                 |
| <b>Step 4</b>  | <b>address</b> { <b>ipv4</b>   <b>ipv6</b> } <i>ip address</i><br><b>Example:</b><br>Device(config-radius-server)# <b>address ipv4 172.24.25.10</b> | (Optional) Specifies the IP address of the RADIUS server.                                                                                                                                                    |
| <b>Step 5</b>  | <b>non-standard</b><br><b>Example:</b><br>Device(config-radius-server)# <b>non-standard</b>                                                         | Identifies that the RADIUS server using a vendor-proprietary implementation of RADIUS.                                                                                                                       |
| <b>Step 6</b>  | <b>key</b> <i>string</i><br><b>Example:</b><br>Device(config-radius-server)# <b>key rad123</b>                                                      | Specifies the shared secret text string used between the device and the vendor-proprietary RADIUS server. The device and the RADIUS server use this text string to encrypt passwords and exchange responses. |
| <b>Step 7</b>  | <b>exit</b><br><b>Example:</b><br>Device(config-radius-server)# <b>exit</b>                                                                         | Exits the RADIUS server mode and enters the global configuration mode.                                                                                                                                       |
| <b>Step 8</b>  | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                         | Returns to privileged EXEC mode.                                                                                                                                                                             |
| <b>Step 9</b>  | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                                                                 | Verifies your entries.                                                                                                                                                                                       |
| <b>Step 10</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                                   | (Optional) Saves your entries in the configuration file.                                                                                                                                                     |

## Configuring CoA on the Device

Follow these steps to configure CoA on a device. This procedure is required.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa server radius dynamic-author**
5. **client** *{ip-address | name}* [*vrf vrfname*] [*server-key string*]
6. **server-key** [*0 | 7*] *string*
7. **port** *port-number*
8. **auth-type** *{any | all | session-key}*
9. **ignore session-key**
10. **ignore server-key**
11. **authentication command bounce-port ignore**
12. **authentication command disable-port ignore**
13. **end**
14. **show running-config**
15. **copy running-config startup-config**

### DETAILED STEPS

|        | Command or Action                                                                                                     | Purpose                                                                                                                                          |
|--------|-----------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                             | Enables privileged EXEC mode. Enter your password if prompted.                                                                                   |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                     | Enters the global configuration mode.                                                                                                            |
| Step 3 | <b>aaa new-model</b><br><b>Example:</b><br>Device(config)# <b>aaa new-model</b>                                       | Enables AAA.                                                                                                                                     |
| Step 4 | <b>aaa server radius dynamic-author</b><br><b>Example:</b><br>Device(config)# <b>aaa server radius dynamic-author</b> | Configures the device as an authentication, authorization, and accounting (AAA) server to facilitate interaction with an external policy server. |

|         | Command or Action                                                                                                                                   | Purpose                                                                                                                                                                                                                                                                                               |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 5  | <b>client</b> { <i>ip-address</i>   <i>name</i> } [ <b>vrf</b> <i>vrfname</i> ] [ <b>server-key</b> <i>string</i> ]                                 | Enters dynamic authorization local server configuration mode and specifies a RADIUS client from which a device will accept CoA and disconnect requests.                                                                                                                                               |
| Step 6  | <b>server-key</b> [0   7] <i>string</i><br><b>Example:</b><br>Device(config-sg-radius)# <b>server-key</b> <i>your_server_key</i>                    | Configures the RADIUS key to be shared between a device and RADIUS clients.                                                                                                                                                                                                                           |
| Step 7  | <b>port</b> <i>port-number</i><br><b>Example:</b><br>Device(config-sg-radius)# <b>port</b> 25                                                       | Specifies the port on which a device listens for RADIUS requests from configured RADIUS clients.                                                                                                                                                                                                      |
| Step 8  | <b>auth-type</b> { <b>any</b>   <b>all</b>   <b>session-key</b> }<br><b>Example:</b><br>Device(config-sg-radius)# <b>auth-type</b> <i>any</i>       | Specifies the type of authorization the device uses for RADIUS clients.<br><br>The client must match all the configured attributes for authorization.                                                                                                                                                 |
| Step 9  | <b>ignore session-key</b>                                                                                                                           | (Optional) Configures the device to ignore the session-key.<br><br>For more information about the <b>ignore</b> command, see the <i>Cisco IOS Intelligent Services Gateway Command Reference</i> on Cisco.com.                                                                                        |
| Step 10 | <b>ignore server-key</b><br><b>Example:</b><br>Device(config-sg-radius)# <b>ignore server-key</b>                                                   | (Optional) Configures the device to ignore the server-key.<br><br>For more information about the <b>ignore</b> command, see the <i>Cisco IOS Intelligent Services Gateway Command Reference</i> on Cisco.com.                                                                                         |
| Step 11 | <b>authentication command bounce-port ignore</b><br><b>Example:</b><br>Device(config-sg-radius)# <b>authentication command bounce-port ignore</b>   | (Optional) Configures the device to ignore a CoA request to temporarily disable the port hosting a session. The purpose of temporarily disabling the port is to trigger a DHCP renegotiation from the host when a VLAN change occurs and there is no supplicant on the endpoint to detect the change. |
| Step 12 | <b>authentication command disable-port ignore</b><br><b>Example:</b><br>Device(config-sg-radius)# <b>authentication command disable-port ignore</b> | (Optional) Configures the device to ignore a nonstandard command requesting that the port hosting a session be administratively shut down. Shutting down the port results in termination of the session.<br><br>Use standard CLI or SNMP commands to re-enable the port.                              |

|         | Command or Action                                                                                                 | Purpose                                                  |
|---------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 13 | <b>end</b><br><b>Example:</b><br>Device(config-sg-radius)# <b>end</b>                                             | Returns to privileged EXEC mode.                         |
| Step 14 | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                               | Verifies your entries.                                   |
| Step 15 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

## Monitoring CoA Functionality

Table 128: Privileged EXEC show Commands

| Command                                    | Purpose                                     |
|--------------------------------------------|---------------------------------------------|
| <b>show aaa attributes protocol radius</b> | Displays AAA attributes of RADIUS commands. |

Table 129: Global Troubleshooting Commands

| Command                                      | Purpose                                                   |
|----------------------------------------------|-----------------------------------------------------------|
| <b>debug radius</b>                          | Displays information for troubleshooting RADIUS.          |
| <b>debug aaa coa</b>                         | Displays information for troubleshooting CoA processing.  |
| <b>debug aaa pod</b>                         | Displays information for troubleshooting POD packets.     |
| <b>debug aaa subsys</b>                      | Displays information for troubleshooting POD packets.     |
| <b>debug cmdhd [detail   error   events]</b> | Displays information for troubleshooting command headers. |

For detailed information about the fields in these displays, see the command reference for this release.

- [Additional References, on page 1588](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Controlling Switch Access with Kerberos

The following are the prerequisites for controlling switch access with Kerberos.

- So that remote users can authenticate to network services, you must configure the hosts and the KDC in the Kerberos realm to communicate and mutually authenticate users and network services. To do this, you must identify them to each other. You add entries for the hosts to the Kerberos database on the KDC and add KEYTAB files generated by the KDC to all hosts in the Kerberos realm. You also create entries for the users in the KDC database.
- A Kerberos server can be a switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

When you add or create entries for the hosts and users, follow these guidelines:

- The Kerberos principal name *must* be in all lowercase characters.
- The Kerberos instance name *must* be in all lowercase characters.

- The Kerberos realm name *must* be in all uppercase characters.

## Information about Kerberos

This section provides Kerberos information.

### Kerberos and Switch Access

This section describes how to enable and configure the Kerberos security system, which authenticates requests for network resources by using a trusted third party.

**Note**

In the Kerberos configuration examples, the trusted third party can be any switch that supports Kerberos, that is configured as a network security server, and that can authenticate users by using the Kerberos protocol.

### Kerberos Overview

Kerberos is a secret-key network authentication protocol, which was developed at the Massachusetts Institute of Technology (MIT). It uses the Data Encryption Standard (DES) cryptographic algorithm for encryption and authentication and authenticates requests for network resources. Kerberos uses the concept of a trusted third party to perform secure verification of users and services. This trusted third party is called the *key distribution center* (KDC).

Kerberos verifies that users are who they claim to be and the network services that they use are what the services claim to be. To do this, a KDC or trusted Kerberos server issues tickets to users. These tickets, which have a limited life span, are stored in user credential caches. The Kerberos server uses the tickets instead of user names and passwords to authenticate users and network services.

**Note**

A Kerberos server can be any switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

The Kerberos credential scheme uses a process called *single logon*. This process authenticates a user once and then allows secure authentication (without encrypting another password) wherever that user credential is accepted.

This software release supports Kerberos 5, which allows organizations that are already using Kerberos 5 to use the same Kerberos authentication database on the KDC that they are already using on their other network hosts (such as UNIX servers and PCs).

Kerberos supports these network services:

- Telnet
- rlogin
- rsh

This table lists the common Kerberos-related terms and definitions.

**Table 130: Kerberos Terms**

| Term                 | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Authentication       | A process by which a user or service identifies itself to another service. For example, a client can authenticate to a switch or a switch can authenticate to another switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Authorization        | A means by which the switch identifies what privileges the user has in a network or on the switch and what actions the user can perform.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Credential           | A general term that refers to authentication tickets, such as TGTs <sup>9</sup> and service credentials. Kerberos credentials verify the identity of a user or service. If a network service decides to trust the Kerberos server that issued a ticket, it can be used in place of re-entering a username and password. Credentials have a default life span of eight hours.                                                                                                                                                                                                                                                                                                                                                                      |
| Instance             | An authorization level label for Kerberos principals. Most Kerberos principals are of the form <i>user@REALM</i> (for example, smith@EXAMPLE.COM). A Kerberos principal with a Kerberos instance has the form <i>user/instance@REALM</i> (for example, smith/admin@EXAMPLE.COM). The Kerberos instance can be used to specify the authorization level for the user if authentication is successful. The server of each network service might implement and enforce the authorization mappings of Kerberos instances but is not required to do so.<br><br><b>Note</b> The Kerberos principal and instance names <i>must</i> be in all lowercase characters.<br><br><b>Note</b> The Kerberos realm name <i>must</i> be in all uppercase characters. |
| KDC <sup>10</sup>    | Key distribution center that consists of a Kerberos server and database program that is running on a network host.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Kerberized           | A term that describes applications and services that have been modified to support the Kerberos credential infrastructure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Kerberos realm       | A domain consisting of users, hosts, and network services that are registered to a Kerberos server. The Kerberos server is trusted to verify the identity of a user or network service to another user or network service.<br><br><b>Note</b> The Kerberos realm name <i>must</i> be in all uppercase characters.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Kerberos server      | A daemon that is running on a network host. Users and network services register their identity with the Kerberos server. Network services query the Kerberos server to authenticate to other network services.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| KEYTAB <sup>11</sup> | A password that a network service shares with the KDC. In Kerberos 5 and later Kerberos versions, the network service authenticates an encrypted service credential by using the KEYTAB to decrypt it. In Kerberos versions earlier than Kerberos 5, KEYTAB is referred to as SRVTAB <sup>12</sup> .                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Principal            | Also known as a Kerberos identity, this is who you are or what a service is according to the Kerberos server.<br><br><b>Note</b> The Kerberos principal name <i>must</i> be in all lowercase characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Term               | Definition                                                                                                                                                                                                    |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Service credential | A credential for a network service. When issued from the KDC, this credential is encrypted with the password shared by the network service and the KDC. The password is also shared with the user TGT.        |
| SRVTAB             | A password that a network service shares with the KDC. In Kerberos 5 or later Kerberos versions, SRVTAB is referred to as KEYTAB.                                                                             |
| TGT                | Ticket granting ticket that is a credential that the KDC issues to authenticated users. When users receive a TGT, they can authenticate to network services within the Kerberos realm represented by the KDC. |

## Kerberos Operation

A Kerberos server can be a device that is configured as a network security server and that can authenticate remote users by using the Kerberos protocol. Although you can customize Kerberos in a number of ways, remote users attempting to access network services must pass through three layers of security before they can access network services.

To authenticate to network services by using a device as a Kerberos server, remote users must follow these steps:

### Authenticating to a Boundary Switch

This section describes the first layer of security through which a remote user must pass. The user must first authenticate to the boundary switch. This process then occurs:

1. The user opens an un-Kerberized Telnet connection to the boundary switch.
2. The switch prompts the user for a username and password.
3. The switch requests a TGT from the KDC for this user.
4. The KDC sends an encrypted TGT that includes the user identity to the switch.
5. The switch attempts to decrypt the TGT by using the password that the user entered.
  - If the decryption is successful, the user is authenticated to the switch.
  - If the decryption is not successful, the user repeats Step 2 either by re-entering the username and password (noting if Caps Lock or Num Lock is on or off) or by entering a different username and password.

A remote user who initiates a un-Kerberized Telnet session and authenticates to a boundary switch is inside the firewall, but the user must still authenticate directly to the KDC before getting access to the network services. The user must authenticate to the KDC because the TGT that the KDC issues is stored on the switch and cannot be used for additional authentication until the user logs on to the switch.

## Obtaining a TGT from a KDC

This section describes the second layer of security through which a remote user must pass. The user must now authenticate to a KDC and obtain a TGT from the KDC to access network services.

For instructions about how to authenticate to a KDC, see the “Obtaining a TGT from a KDC” section in the “Security Server Protocols” chapter of the *Cisco IOS Security Configuration Guide, Release 12.4*.

## Authenticating to Network Services

This section describes the third layer of security through which a remote user must pass. The user with a TGT must now authenticate to the network services in a Kerberos realm.

For instructions about how to authenticate to a network service, see the “Authenticating to Network Services” section in the “Security Server Protocols” chapter of the *Cisco IOS Security Configuration Guide, Release 12.4*.

# How to Configure Kerberos

To set up a Kerberos-authenticated server-client system, follow these steps:

- Configure the KDC by using Kerberos commands.
- Configure the switch to use the Kerberos protocol.

# Monitoring the Kerberos Configuration

To display the Kerberos configuration, use the following commands:

- **show running-config**
- **show kerberos creds**: Lists the credentials in a current user’s credentials cache.
- **clear kerberos creds**: Destroys all credentials in a current user’s credentials cache, including those forwarded.

## CHAPTER 79

# Configuring Local Authentication and Authorization

---

- [Finding Feature Information, on page 1591](#)
- [How to Configure Local Authentication and Authorization, on page 1591](#)
- [Monitoring Local Authentication and Authorization, on page 1594](#)
- [Additional References, on page 1594](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## How to Configure Local Authentication and Authorization

### Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

---

**Note** To secure the switch for HTTP access by using AAA methods, you must configure the switch with the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

---

Follow these steps to configure AAA to operate without a server by setting the switch to implement AAA in local mode:

## SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login default local`
5. `aaa authorization exec local`
6. `aaa authorization network local`
7. `username name [privilege level] {password encryption-type password}`
8. `end`
9. `show running-config`
10. `copy running-config startup-config`

## DETAILED STEPS

|        | Command or Action                                                                                                                     | Purpose                                                                                                                                                   |
|--------|---------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                      | Enables privileged EXEC mode. Enter your password if prompted.                                                                                            |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                 | Enters the global configuration mode.                                                                                                                     |
| Step 3 | <b>aaa new-model</b><br><b>Example:</b><br><pre>Device(config)# aaa new-model</pre>                                                   | Enables AAA.                                                                                                                                              |
| Step 4 | <b>aaa authentication login default local</b><br><b>Example:</b><br><pre>Device(config)# aaa authentication login default local</pre> | Sets the login authentication to use the local username database. The <b>default</b> keyword applies the local user database authentication to all ports. |
| Step 5 | <b>aaa authorization exec local</b><br><b>Example:</b><br><pre>Device(config)# aaa authorization exec local</pre>                     | Configures user AAA authorization, check the local database, and allow the user to run an EXEC shell.                                                     |
| Step 6 | <b>aaa authorization network local</b><br><b>Example:</b>                                                                             | Configures user AAA authorization for all network-related service requests.                                                                               |

|                | Command or Action                                                                                                                                                                                                                             | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring Secure Shell

The following are the prerequisites for configuring the switch for secure shell (SSH):

- For SSH to work, the switch needs an Rivest, Shamir, and Adleman (RSA) public/private key pair. This is the same with Secure Copy Protocol (SCP), which relies on SSH for its secure transport.
- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.
- SCP relies on SSH for security.
- SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.
- A user must have appropriate authorization to use SCP.

- A user who has appropriate authorization can use SCP to copy any file in the Cisco IOS File System (IFS) to and from a switch by using the **copy** command. An authorized administrator can also do this from a workstation.
- The Secure Shell (SSH) server requires an IPsec (Data Encryption Standard [DES] or 3DES) encryption software image; the SSH client requires an IPsec (DES or 3DES) encryption software image.)
- Configure a hostname and host domain for your device by using the **hostname** and **ip domain-name** commands in global configuration mode.

## Restrictions for Configuring Secure Shell

The following are restrictions for configuring the Device for secure shell.

- The switch supports Rivest, Shamir, and Adelman (RSA) authentication.
- SSH supports only the execution-shell application.
- The SSH server and the SSH client are supported only on Data Encryption Standard (DES) (56-bit) and 3DES (168-bit) data encryption software. In DES software images, DES is the only encryption algorithm available. In 3DES software images, both DES and 3DES encryption algorithms are available.
- The Device supports the Advanced Encryption Standard (AES) encryption algorithm with a 128-bit key, 192-bit key, or 256-bit key. However, symmetric cipher AES to encrypt the keys is not supported.
- This software release does not support IP Security (IPSec).
- When using SCP, you cannot enter the password into the **copy** command. You must enter the password when prompted.
- The login banner is not supported in Secure Shell Version 1. It is supported in Secure Shell Version 2.
- The **-l** keyword and **userid** : {number} {ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for console access.

## Information about SSH

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

## SSH and Switch Access

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

SSH functions the same in IPv6 as in IPv4. For IPv6, SSH supports IPv6 addresses and enables secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.

## SSH Servers, Integrated Clients, and Supported Versions

The Secure Shell (SSH) Integrated Client feature is an application that runs over the SSH protocol to provide device authentication and encryption. The SSH client enables a Cisco device to make a secure, encrypted connection to another Cisco device or to any other device running the SSH server. This connection provides functionality similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for secure communication over an unsecured network.

The SSH server and SSH integrated client are applications that run on the switch. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client works with publicly and commercially available SSH servers. The SSH client supports the ciphers of Data Encryption Standard (DES), 3DES, and password authentication.

The switch supports an SSHv1 or an SSHv2 server.

The switch supports an SSHv1 client.

---

**Note** The SSH client functionality is available only when the SSH server is enabled.

---

User authentication is performed like that in the Telnet session to the device. SSH also supports the following user authentication methods:

- TACACS+
- RADIUS
- Local authentication and authorization

## SSH Configuration Guidelines

Follow these guidelines when configuring the switch as an SSH server or SSH client:

- An RSA key pair generated by a SSHv1 server can be used by an SSHv2 server, and the reverse.
- If the SSH server is running on a stack master and the stack master fails, the new stack master uses the RSA key pair generated by the previous stack master.
- If you get CLI error messages after entering the **crypto key generate rsa** global configuration command, an RSA key pair has not been generated. Reconfigure the hostname and domain, and then enter the **crypto key generate rsa** command. For more information, see Related Topics below.
- When generating the RSA key pair, the message No host name specified might appear. If it does, you must configure a hostname by using the **hostname** global configuration command.

- When generating the RSA key pair, the message No domain specified might appear. If it does, you must configure an IP domain name by using the **ip domain-name** global configuration command.
- When configuring the local authentication and authorization authentication method, make sure that AAA is disabled on the console.

## Secure Copy Protocol Overview

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

For SSH to work, the switch needs an RSA public/private key pair. This is the same with SCP, which relies on SSH for its secure transport.

Because SSH also relies on AAA authentication, and SCP relies further on AAA authorization, correct configuration is necessary.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

---

**Note**

When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

---

## Secure Copy Protocol

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying device configurations or switch image files. The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. SCP also requires that authentication, authorization, and accounting (AAA) authorization be configured so the device can determine whether the user has the correct privilege level. To configure the Secure Copy feature, you should understand the SCP concepts.

# How to Configure SSH

## Setting Up the Device to Run SSH

Follow these steps to set up your Device to run SSH:

### Before you begin

Configure user authentication for local or remote access. This step is required. For more information, see Related Topics below.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `hostname hostname`
4. `ip domain-name domain_name`
5. `crypto key generate rsa`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                                                         | Purpose                                                                                                                                                 |
|--------|-----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                           | Enables privileged EXEC mode. Enter your password if prompted.                                                                                          |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                   | Enters the global configuration mode.                                                                                                                   |
| Step 3 | <b>hostname <i>hostname</i></b><br><b>Example:</b><br>Device(config)# <code>hostname your_hostname</code> | Configures a hostname and IP domain name for your Device.<br><b>Note</b> Follow this procedure only if you are configuring the Device as an SSH server. |
| Step 4 | <b>ip domain-name <i>domain_name</i></b><br><b>Example:</b>                                               | Configures a host domain for your Device.                                                                                                               |

|               | Command or Action                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device(config)# <code>ip domain-name your_domain</code>                                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 5</b> | <b>crypto key generate rsa</b><br><b>Example:</b><br>Device(config)# <code>crypto key generate rsa</code>               | Enables the SSH server for local and remote authentication on the Device and generates an RSA key pair. Generating an RSA key pair for the Device automatically enables SSH.<br><br>We recommend that a minimum modulus size of 1024 bits.<br><br>When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use.<br><br><b>Note</b> Follow this procedure only if you are configuring the Device as an SSH server. |
| <b>Step 6</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <code>end</code>                                                       | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 7</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                               | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 8</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Configuring the SSH Server

Follow these steps to configure the SSH server:

**Note** This procedure is only required if you are configuring the Device as an SSH server.

### SUMMARY STEPS

1. `enable`

2. **configure terminal**
3. **ip ssh version [1 | 2]**
4. **ip ssh {timeout *seconds* | authentication-retries *number*}**
5. Use one or both of the following:
  - **line vtyline\_number[ending\_line\_number]**
  - **transport input ssh**
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

## DETAILED STEPS

|        | Command or Action                                                                                                                                                               | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                       | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Step 2 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                               | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Step 3 | <b>ip ssh version [1   2]</b><br><b>Example:</b><br>Device(config)# <b>ip ssh version 1</b>                                                                                     | (Optional) Configures the Device to run SSH Version 1 or SSH Version 2. <ul style="list-style-type: none"> <li>• <b>1</b>—Configure the Device to run SSH Version 1.</li> <li>• <b>2</b>—Configure the Device to run SSH Version 2.</li> </ul> If you do not enter this command or do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2.                                                                                                                                                     |
| Step 4 | <b>ip ssh {timeout <i>seconds</i>   authentication-retries <i>number</i>}</b><br><b>Example:</b><br>Device(config)# <b>ip ssh timeout 90</b><br><b>authentication-retries 2</b> | Configures the SSH control parameters: <ul style="list-style-type: none"> <li>• Specify the time-out value in seconds; the default is 120 seconds. The range is 0 to 120 seconds. This parameter applies to the SSH negotiation phase. After the connection is established, the Device uses the default time-out values of the CLI-based sessions.</li> </ul> By default, up to five simultaneous, encrypted SSH connections for multiple CLI-based sessions over the network are available (session 0 to session 4). After the execution shell starts, the CLI-based session time-out value returns to the default of 10 minutes. |

|               | Command or Action                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                                                                                                                                                                                                                   | <ul style="list-style-type: none"> <li>Specify the number of times that a client can re-authenticate to the server. The default is 3; the range is 0 to 5.</li> </ul> <p>Repeat this step when configuring both parameters.</p>                                                                                                                                                                                                |
| <b>Step 5</b> | <p>Use one or both of the following:</p> <ul style="list-style-type: none"> <li><code>line vtyline_number[ending_line_number]</code></li> <li><b>transport input ssh</b></li> </ul> <p><b>Example:</b></p> <pre>Device(config)# line vty 1 10</pre> <p>or</p> <pre>Device(config-line)# transport input ssh</pre> | <p>(Optional) Configures the virtual terminal line settings.</p> <ul style="list-style-type: none"> <li>Enters line configuration mode to configure the virtual terminal line settings. For <i>line_number</i> and <i>ending_line_number</i>, specify a pair of lines. The range is 0 to 15.</li> <li>Specifies that the Device prevent non-SSH Telnet connections. This limits the router to only SSH connections.</li> </ul> |
| <b>Step 6</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-line)# end</pre>                                                                                                                                                                                                                                      | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 7</b> | <p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>                                                                                                                                                                                                                   | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 8</b> | <p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>                                                                                                                                                                                     | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                       |

## Monitoring the SSH Configuration and Status

This table displays the SSH server configuration and status.

*Table 131: Commands for Displaying the SSH Server Configuration and Status*

| Command            | Purpose                                                             |
|--------------------|---------------------------------------------------------------------|
| <b>show ip ssh</b> | Shows the version and configuration information for the SSH server. |
| <b>show ssh</b>    | Shows the status of the SSH server.                                 |

# CHAPTER 81

## X.509v3 Certificates for SSH Authentication

- [X.509v3 Certificates for SSH Authentication, on page 1605](#)
- [Information About X.509v3 Certificates for SSH Authentication, on page 1606](#)
- [How to Configure X.509v3 Certificates for SSH Authentication, on page 1606](#)
- [Configuration Examples for X.509v3 Certificates for SSH Authentication, on page 1610](#)
- [Additional References for X.509v3 Certificates for SSH Authentication, on page 1611](#)
- [Feature Information for X.509v3 Certificates for SSH Authentication, on page 1612](#)

### X.509v3 Certificates for SSH Authentication

The X.509v3 Certificates for secure shell (SSH) Authentication feature uses the X.509v3 digital certificates in server and user authentication at the SSH server side.

### Prerequisites for Digital Certificates for SSH Authentication

The Digital Certificates for SSH Authentication feature introduces the **ip ssh server algorithm authentication** command to replace the **ip ssh server authenticate user** command. If you use the **ip ssh server authenticate user** command, the following deprecation message is displayed.

```
Warning: SSH command accepted but this CLI will be deprecated soon. Please move to new CLI
"ip ssh server algorithm authentication". Please configure "default ip ssh server
authenticate user" to make CLI ineffective.
```

Use the **default ip ssh server authenticate user** command to remove the **ip ssh server authenticate user** command from effect. The IOS secure shell (SSH) server then starts using the **ip ssh server algorithm authentication** command.

### Restrictions for X.509v3 Certificates for SSH Authentication

The following restrictions are applicable for X.509v3 Certificate for SSH Authentication:

- The X.509v3 Certificates for SSH Authentication feature implementation is applicable only on the IOS secure shell (SSH) server side.
- IOS SSH server supports only the x509v3-ssh-rsa algorithm based certificate for server and user authentication on the IOS SSH server side.

The X.509v3 Certificate for SSH Authentication fails in the following conditions:

- When root certification authority is configured as a trustpoint on the device.
- When a client passes a certificate chain that leads to a self-signed root certificate authority that includes a client certificate, sub-ca certificate, and self-signed root certificate authority.
- When a sub-ca certification is configured as a trustpoint on the device but not included as a trustpoint on the user certificate.

## Information About X.509v3 Certificates for SSH Authentication

The following section provides information about digital certificates, and server and user authentication.

### Digital Certificates

The validity of the authentication depends upon the strength of the linkage between the public signing key and the identity of the signer. Digital certificates in the X.509v3 format (RFC5280) are used to provide identity management. A chain of signatures by a trusted root certification authority and its intermediate certificate authorities binds a given public signing key to a given digital identity.

Public key infrastructure (PKI) trustpoint helps manage the digital certificates. The association between the certificate and the trustpoint helps track the certificate. The trustpoint contains information about the certificate authority (CA), different identity parameters, and the digital certificate. Multiple trustpoints can be created to associate with different certificates.

### Server and User Authentication using X.509v3

For server authentication, the IOS secure shell (SSH) server sends its own certificate to the SSH client for verification. This server certificate is associated with the trustpoint configured in the server certificate profile (ssh-server-cert-profile-server configuration mode).

For user authentication, the SSH client sends the user's certificate to the IOS SSH server for verification. The SSH server validates the incoming user certificate using public key infrastructure (PKI) trustpoints configured in the server certificate profile (ssh-server-cert-profile-user configuration mode).

By default, certificate-based authentication is enabled for server and user at the IOS SSH server end.

## How to Configure X.509v3 Certificates for SSH Authentication

The following section provides information about how to configure X.509v3 Certificates for SSH Authentication.

### Configuring IOS SSH Server to Use Digital Certificates for Sever Authentication

The following section provides information about Configuring IOS SSH Server to Use Digital Certificates for Sever Authentication.

## Procedure

|               | Command or Action                                                                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                | Enables privileged EXEC mode.<br>Enter your password if prompted.                                                                                                                                                                                                                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                        | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 3</b> | <b>ip ssh server algorithm hostkey {x509v3-ssh-rsa [ssh-rsa]   ssh-rsa [x509v3-ssh-rsa]}</b><br><b>Example:</b><br>Device(config)# <b>ip ssh server algorithm hostkey x509v3-ssh-rsa</b> | Defines the order of host key algorithms. Only the configured algorithm is negotiated with the secure shell (SSH) client.<br><br><b>Note</b> The IOS SSH server must have at least one configured host key algorithm: <ul style="list-style-type: none"> <li>• ssh-rsa – public key based authentication</li> <li>• x509v3-ssh-rsa – certificate-based authentication</li> </ul> |
| <b>Step 4</b> | <b>ip ssh server certificate profile</b><br><b>Example:</b><br>Device(config)# <b>ip ssh server certificate profile</b>                                                                  | Configures server certificate profile and user certificate profile and enters SSH certificate profile configuration mode.                                                                                                                                                                                                                                                        |
| <b>Step 5</b> | <b>server</b><br><b>Example:</b><br>Device(ssh-server-cert-profile)# <b>server</b>                                                                                                       | Configures server certificate profile and enters SSH server certificate profile server configuration mode.                                                                                                                                                                                                                                                                       |
| <b>Step 6</b> | <b>trustpoint sign <i>PKI-trustpoint-name</i></b><br><b>Example:</b><br>Device(ssh-server-cert-profile-server)# <b>trustpoint sign trust1</b>                                            | Attaches the public key infrastructure (PKI) trustpoint to the server certificate profile. The SSH server uses the certificate associated with this PKI trustpoint for server authentication.                                                                                                                                                                                    |
| <b>Step 7</b> | <b>ocsp-response include</b><br><b>Example:</b><br>Device(ssh-server-cert-profile-server)# <b>ocsp-response include</b>                                                                  | (Optional) Sends the Online Certificate Status Protocol (OCSP) response or OCSP stapling along with the server certificate.<br><br><b>Note</b> By default the “no” form of this command is configured and no OCSP response is sent along with the server certificate.                                                                                                            |
| <b>Step 8</b> | <b>end</b><br><b>Example:</b>                                                                                                                                                            | Exits SSH server certificate profile server configuration mode and enters privileged EXEC mode.                                                                                                                                                                                                                                                                                  |

|  | Command or Action                                    | Purpose |

## Configuring IOS SSH Server to Verify User's Digital Certificate for User Authentication

The following section provides information about configuring IOS SSH Server to Verify User's Digital Certificate for User Authentication.

### Procedure

|               | Command or Action                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                    | Enables privileged EXEC mode.<br>Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                            | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>ip ssh server algorithm authentication {publickey   keyboard   password}</b><br><b>Example:</b><br>Device(config)# <b>ip ssh server algorithm authentication publickey</b>                | Defines the order of user authentication algorithms. Only the configured algorithm is negotiated with the secure shell (SSH) client.<br><b>Note</b> <ul style="list-style-type: none"> <li>The IOS SSH server must have at least one configured user authentication algorithm.</li> <li>To use the certificate method for user authentication, the <b>publickey</b> keyword must be configured.</li> <li>The <b>ip ssh server algorithm authentication</b> command replaces the <b>ip ssh server authenticate user</b> command.</li> </ul> |
| <b>Step 4</b> | <b>ip ssh server algorithm publickey {x509v3-ssh-rsa [ssh-rsa]   ssh-rsa [x509v3-ssh-rsa]}</b><br><b>Example:</b><br>Device(config)# <b>ip ssh server algorithm publickey x509v3-ssh-rsa</b> | Defines the order of public key algorithms. Only the configured algorithm is accepted by the SSH client for user authentication.<br><b>Note</b> The IOS SSH client must have at least one configured public key algorithm: <ul style="list-style-type: none"> <li>ssh-rsa – public-key-based authentication</li> <li>x509v3-ssh-rsa – certificate-based authentication</li> </ul>                                                                                                                                                          |

|               | Command or Action                                                                                                                        | Purpose                                                                                                                                                                                                                                                                 |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 5</b> | <b>ip ssh server certificate profile</b><br><b>Example:</b><br>Device(config)# <b>ip ssh server certificate profile</b>                  | Configures server certificate profile and user certificate profile and enters SSH certificate profile configuration mode.                                                                                                                                               |
| <b>Step 6</b> | <b>user</b><br><b>Example:</b><br>Device(ssh-server-cert-profile)# <b>user</b>                                                           | Configures user certificate profile and enters SSH server certificate profile user configuration mode.                                                                                                                                                                  |
| <b>Step 7</b> | <b>trustpoint verify PKI-trustpoint-name</b><br><b>Example:</b><br>Device(ssh-server-cert-profile-user)# <b>trustpoint verify trust2</b> | Configures the public key infrastructure (PKI) trustpoint that is used to verify the incoming user certificate.<br><br><b>Note</b> Configure multiple trustpoints by executing the same command multiple times. A maximum of 10 trustpoints can be configured.          |
| <b>Step 8</b> | <b>ocsp-response required</b><br><b>Example:</b><br>Device(ssh-server-cert-profile-user)# <b>ocsp-response required</b>                  | (Optional) Mandates the presence of the Online Certificate Status Protocol (OCSP) response with the incoming user certificate.<br><br><b>Note</b> By default the “no” form of this command is configured and the user certificate is accepted without an OCSP response. |
| <b>Step 9</b> | <b>end</b><br><b>Example:</b><br>Device(ssh-server-cert-profile-user)# <b>end</b>                                                        | Exits SSH server certificate profile user configuration mode and enters privileged EXEC mode.                                                                                                                                                                           |

## Verifying Configuration for Server and User Authentication Using Digital Certificates

The following section provides information about verifying configuration for Server and User Authentication Using Digital Certificates.

### Procedure

|               | Command or Action                                         | Purpose                                                                                                                   |
|---------------|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b> | Enables privileged EXEC mode.<br><br><ul style="list-style-type: none"> <li>• Enter your password if prompted.</li> </ul> |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                        | Purpose                                                                                                                                                                                          |

| <b>Step 2</b> | <b>show ip ssh</b><br><b>Example:</b><br><pre>Device# show ip ssh  SSH Enabled - version 1.99 Authentication methods:publickey,keyboard-interactive,password Authentication Publickey Algorithms:x509v3-ssh-rsa,ssh-rsa Hostkey Algorithms:x509v3-ssh-rsa,ssh-rsa Authentication timeout: 120 secs; Authentication retries: 3 Minimum expected Diffie Hellman key size : 1024 bits</pre> | Displays the currently configured authentication methods. To confirm the use of certificate-based authentication, ensure that the x509v3-ssh-rsa algorithm is the configured host key algorithm. |

## Configuration Examples for X.509v3 Certificates for SSH Authentication

The following section provides examples for user and server authentication using digital certificates.

### Example: Configuring IOS SSH Server to Use Digital Certificates for Server Authentication

This example shows how to configure IOS SSH Server to Use Digital Certificates for Server Authentication.

```
Device> enable
Device# configure terminal
Device(config)# ip ssh server algorithm hostkey x509v3-ssh-rsa
Device(config)# ip ssh server certificate profile
Device(ssh-server-cert-profile)# server
Device(ssh-server-cert-profile-server)# trustpoint sign trust1
Device(ssh-server-cert-profile-server)# exit
```

### Example: Configuring IOS SSH Server to Verify User's Digital Certificate for User Authentication

This example shows how to configure IOS SSH Server to Verify User's Digital Certificate for User Authentication.

```
Device> enable
Device# configure terminal
```

```

Device(config)# ip ssh server algorithm authentication publickey
Device(config)# ip ssh server algorithm publickey x509v3-ssh-rsa
Device(config)# ip ssh server certificate profile
Device(ssh-server-cert-profile)# user
Device(ssh-server-cert-profile-user)# trustpoint verify trust2
Device(ssh-server-cert-profile-user)# end

```

# Feature Information for X.509v3 Certificates for SSH Authentication

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Table 132: Feature Information for X.509v3 Certificates for SSH Authentication**

| Feature Information                         | Release                    | Modification                                                                                                                                                          |

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information about Secure Sockets Layer (SSL) HTTP

### Secure HTTP Servers and Clients Overview

On a secure HTTP connection, data to and from an HTTP server is encrypted before being sent over the Internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a switch from a Web browser. Cisco's implementation of the secure HTTP server and secure HTTP client uses an implementation of SSL Version 3.0 with application-layer encryption. HTTP over SSL is abbreviated as HTTPS; the URL of a secure connection begins with `https://` instead of `http://`.

---

**Note** SSL evolved into Transport Layer Security (TLS) in 1999, but is still used in this particular context.

---

The primary role of the HTTP secure server (the switch) is to listen for HTTPS requests on a designated port (the default HTTPS port is 443) and pass the request to the HTTP 1.1 Web server. The HTTP 1.1 server

processes requests and passes responses (pages) back to the HTTP secure server, which, in turn, responds to the original request.

The primary role of the HTTP secure client (the web browser) is to respond to Cisco IOS application requests for HTTPS User Agent services, perform HTTPS User Agent services for the application, and pass the response back to the application.

## Certificate Authority Trustpoints

Certificate authorities (CAs) manage certificate requests and issue certificates to participating network devices. These services provide centralized security key and certificate management for the participating devices. Specific CA servers are referred to as *trustpoints*.

When a connection attempt is made, the HTTPS server provides a secure connection by issuing a certified X.509v3 certificate, obtained from a specified CA trustpoint, to the client. The client (usually a Web browser), in turn, has a public key that allows it to authenticate the certificate.

For secure HTTP connections, we highly recommend that you configure a CA trustpoint. If a CA trustpoint is not configured for the device running the HTTPS server, the server certifies itself and generates the needed RSA key pair. Because a self-certified (self-signed) certificate does not provide adequate security, the connecting client generates a notification that the certificate is self-certified, and the user has the opportunity to accept or reject the connection. This option is useful for internal network topologies (such as testing).

If you do not configure a CA trustpoint, when you enable a secure HTTP connection, either a temporary or a persistent self-signed certificate for the secure HTTP server (or client) is automatically generated.

- If the switch is not configured with a hostname and a domain name, a temporary self-signed certificate is generated. If the switch reboots, any temporary self-signed certificate is lost, and a new temporary new self-signed certificate is assigned.
- If the switch has been configured with a host and domain name, a persistent self-signed certificate is generated. This certificate remains active if you reboot the switch or if you disable the secure HTTP server so that it will be there the next time you re-enable a secure HTTP connection.

### Note

The certificate authorities and trustpoints must be configured on each device individually. Copying them from other devices makes them invalid on the switch.

When a new certificate is enrolled, the new configuration change is not applied to the HTTPS server until the server is restarted. You can restart the server using either the CLI or by physical reboot. On restarting the server, the switch starts using the new certificate.

If a self-signed certificate has been generated, this information is included in the output of the **show running-config** privileged EXEC command. This is a partial sample output from that command displaying a self-signed certificate.

```
Device# show running-config
Building configuration...

<output truncated>

crypto pki trustpoint TP-self-signed-3080755072
 enrollment selfsigned
 subject-name cn=IOS-Self-Signed-Certificate-3080755072
```

```

revocation-check none
rsakeypair TP-self-signed-3080755072
!
!
crypto ca certificate chain TP-self-signed-3080755072
certificate self-signed 01
 3082029F 30820208 A0030201 02020101 300D0609 2A864886 F70D0101 04050030
59312F30 2D060355 04031326 494F532D 53656C66 2D536967 6E65642D 43657274
69666963 6174652D 33303830 37353530 37323126 30240609 2A864886 F70D0109
02161743 45322D33 3535302D 31332E73 756D6D30 342D3335 3530301E 170D3933
30333031 30303030 35395A17 0D323030 31303130 30303030 305A3059 312F302D

```

<output truncated>

You can remove this self-signed certificate by disabling the secure HTTP server and entering the **no crypto pki trustpoint TP-self-signed-30890755072** global configuration command. If you later re-enable a secure HTTP server, a new self-signed certificate is generated.

**Note** The values that follow *TP self-signed* depend on the serial number of the device.

You can use an optional command (**ip http secure-client-auth**) to allow the HTTPS server to request an X.509v3 certificate from the client. Authenticating the client provides more security than server authentication by itself.

For additional information on Certificate Authorities, see the “Configuring Certification Authority Interoperability” chapter in the *Cisco IOS Security Configuration Guide, Release 12.4*.

## CipherSuites

A CipherSuite specifies the encryption algorithm and the digest algorithm to use on a SSL connection. When connecting to the HTTPS server, the client Web browser offers a list of supported CipherSuites, and the client and server negotiate the best encryption algorithm to use from those on the list that are supported by both. For example, Netscape Communicator 4.76 supports U.S. security with RSA Public Key Cryptography, MD2, MD5, RC2-CBC, RC4, DES-CBC, and DES-EDE3-CBC.

For the best possible encryption, you should use a client browser that supports 128-bit encryption, such as Microsoft Internet Explorer Version 5.5 (or later) or Netscape Communicator Version 4.76 (or later). The `SSL_RSA_WITH_DES_CBC_SHA` CipherSuite provides less security than the other CipherSuites, as it does not offer 128-bit encryption.

The more secure and more complex CipherSuites require slightly more processing time. This list defines the CipherSuites supported by the switch and ranks them from fastest to slowest in terms of router processing load (speed):

1. `SSL_RSA_WITH_DES_CBC_SHA`—RSA key exchange (RSA Public Key Cryptography) with DES-CBC for message encryption and SHA for message digest
2. `SSL_RSA_WITH_NULL_SHA` key exchange with NULL for message encryption and SHA for message digest (only for SSL 3.0).
3. `SSL_RSA_WITH_NULL_MD5` key exchange with NULL for message encryption and MD5 for message digest (only for SSL 3.0).
4. `SSL_RSA_WITH_RC4_128_MD5`—RSA key exchange with RC4 128-bit encryption and MD5 for message digest

5. `SSL_RSA_WITH_RC4_128_SHA`—RSA key exchange with RC4 128-bit encryption and SHA for message digest
6. `SSL_RSA_WITH_3DES_EDE_CBC_SHA`—RSA key exchange with 3DES and DES-EDE3-CBC for message encryption and SHA for message digest
7. `SSL_RSA_WITH_AES_128_CBC_SHA`—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).
8. `SSL_RSA_WITH_AES_256_CBC_SHA`—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).
9. `SSL_RSA_WITH_DHE_AES_128_CBC_SHA`—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).
10. `SSL_RSA_WITH_DHE_AES_256_CBC_SHA`—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).

---

**Note** The latest versions of Chrome do not support the four original cipher suites, thus disallowing access to both web GUI and guest portals.

---

RSA (in conjunction with the specified encryption and digest algorithm combinations) is used for both key generation and authentication on SSL connections. This usage is independent of whether or not a CA trustpoint is configured.

## Default SSL Configuration

- The standard HTTP server is enabled.
- SSL is enabled.
- No CA trustpoints are configured.
- No self-signed certificates are generated.

## SSL Configuration Guidelines

When SSL is used in a switch cluster, the SSL session terminates at the cluster commander. Cluster member switches must run standard HTTP.

Before you configure a CA trustpoint, you should ensure that the system clock is set. If the clock is not set, the certificate is rejected due to an incorrect date.

In a switch stack, the SSL session terminates at the stack master.

# How to Configure Secure HTTP Servers and Clients

## Configuring a CA Trustpoint

For secure HTTP connections, we recommend that you configure an official CA trustpoint. A CA trustpoint is more secure than a self-signed certificate.

Beginning in privileged EXEC mode, follow these steps to configure a CA Trustpoint:

### SUMMARY STEPS

1. **configure terminal**
2. **hostname** *hostname*
3. **ip domain-name** *domain-name*
4. **crypto key generate rsa**
5. **crypto ca trustpoint** *name*
6. **enrollment url** *url*
7. **enrollment http-proxy** *host-name port-number*
8. **crl query** *url*
9. **primary** *name*
10. **exit**
11. **crypto ca authentication** *name*
12. **crypto ca enroll** *name*
13. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                | Purpose                                                                                                                                                                             |
|---------------|------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                | Enters the global configuration mode.                                                                                                                                               |
| <b>Step 2</b> | <b>hostname</b> <i>hostname</i><br><b>Example:</b><br>Device(config)# <b>hostname your_hostname</b>              | Specifies the hostname of the switch (required only if you have not previously configured a hostname). The hostname is required for security keys and certificates.                 |
| <b>Step 3</b> | <b>ip domain-name</b> <i>domain-name</i><br><b>Example:</b><br>Device(config)# <b>ip domain-name your_domain</b> | Specifies the IP domain name of the switch (required only if you have not previously configured an IP domain name). The domain name is required for security keys and certificates. |

|                | Command or Action                                                                                                                         | Purpose                                                                                                                                                                                                                                                                                                    |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 4</b>  | <b>crypto key generate rsa</b><br><b>Example:</b><br>Device(config)# <b>crypto key generate rsa</b>                                       | (Optional) Generates an RSA key pair. RSA key pairs are required before you can obtain a certificate for the switch. RSA key pairs are generated automatically. You can use this command to regenerate the keys, if needed.                                                                                |
| <b>Step 5</b>  | <b>crypto ca trustpoint name</b><br><b>Example:</b><br>Device(config)# <b>crypto ca trustpoint your_trustpoint</b>                        | Specifies a local configuration name for the CA trustpoint and enter CA trustpoint configuration mode.                                                                                                                                                                                                     |
| <b>Step 6</b>  | <b>enrollment url url</b><br><b>Example:</b><br>Device(ca-trustpoint)# <b>enrollment url http://your_server:80</b>                        | Specifies the URL to which the switch should send certificate requests.                                                                                                                                                                                                                                    |
| <b>Step 7</b>  | <b>enrollment http-proxy host-name port-number</b><br><b>Example:</b><br>Device(ca-trustpoint)# <b>enrollment http-proxy your_host 49</b> | (Optional) Configures the switch to obtain certificates from the CA through an HTTP proxy server. <ul style="list-style-type: none"> <li>• For <i>host-name</i>, specify the proxy server used to get the CA.</li> <li>• For <i>port-number</i>, specify the port number used to access the CA.</li> </ul> |
| <b>Step 8</b>  | <b>crl query url</b><br><b>Example:</b><br>Device(ca-trustpoint)# <b>crl query ldap://your_host:49</b>                                    | Configures the switch to request a certificate revocation list (CRL) to ensure that the certificate of the peer has not been revoked.                                                                                                                                                                      |
| <b>Step 9</b>  | <b>primary name</b><br><b>Example:</b><br>Device(ca-trustpoint)# <b>primary your_trustpoint</b>                                           | (Optional) Specifies that the trustpoint should be used as the primary (default) trustpoint for CA requests. <ul style="list-style-type: none"> <li>• For <i>name</i>, specify the trustpoint that you just configured.</li> </ul>                                                                         |
| <b>Step 10</b> | <b>exit</b><br><b>Example:</b><br>Device(ca-trustpoint)# <b>exit</b>                                                                      | Exits CA trustpoint configuration mode and return to global configuration mode.                                                                                                                                                                                                                            |
| <b>Step 11</b> | <b>crypto ca authentication name</b><br><b>Example:</b><br>Device(config)# <b>crypto ca authentication</b>                                | Authenticates the CA by getting the public key of the CA. Use the same name used in Step 5.                                                                                                                                                                                                                |

|                | Command or Action                                                                                                 | Purpose                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
|                | <code>your_trustpoint</code>                                                                                      |                                                                                                                             |
| <b>Step 12</b> | <b>crypto ca enroll <i>name</i></b><br><b>Example:</b><br>Device(config)# <b>crypto ca enroll your_trustpoint</b> | Obtains the certificate from the specified CA trustpoint. This command requests a signed certificate for each RSA key pair. |
| <b>Step 13</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                                                                            |

## Configuring the Secure HTTP Server

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP server:

### Before you begin

If you are using a certificate authority for certification, you should use the previous procedure to configure the CA trustpoint on the switch before enabling the HTTP server. If you have not configured a CA trustpoint, a self-signed certificate is generated the first time that you enable the secure HTTP server. After you have configured the server, you can configure options (path, access list to apply, maximum number of connections, or timeout policy) that apply to both standard and secure HTTP servers.

To verify the secure HTTP connection by using a Web browser, enter `https://URL`, where the URL is the IP address or hostname of the server switch. If you configure a port other than the default port, you must also specify the port number after the URL. For example:

```
https://209.165.129:1026
```

or

```
https://host.domain.com:1026
```

### SUMMARY STEPS

1. **show ip http server status**
2. **configure terminal**
3. **ip http secure-server**
4. **ip http secure-port *port-number***
5. **ip http secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}**
6. **ip http secure-client-auth**
7. **ip http secure-trustpoint *name***
8. **ip http path *path-name***
9. **ip http access-class *access-list-number***

10. `ip http max-connections value`
11. `ip http timeout-policy idle seconds life seconds requests value`
12. `end`

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                | Purpose                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>show ip http server status</b></p> <p><b>Example:</b></p> <pre>Device# show ip http server status</pre>                                                                                    | <p>(Optional) Displays the status of the HTTP server to determine if the secure HTTP server feature is supported in the software. You should see one of these lines in the output:</p> <pre>HTTP secure server capability: Present</pre> <p>or</p> <pre>HTTP secure server capability: Not present</pre> |
| <b>Step 2</b> | <p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>                                                                                                    | Enters global configuration mode.                                                                                                                                                                                                                                                                        |
| <b>Step 3</b> | <p><b>ip http secure-server</b></p> <p><b>Example:</b></p> <pre>Device(config)# ip http secure-server</pre>                                                                                      | Enables the HTTPS server if it has been disabled. The HTTPS server is enabled by default.                                                                                                                                                                                                                |
| <b>Step 4</b> | <p><b>ip http secure-port port-number</b></p> <p><b>Example:</b></p> <pre>Device(config)# ip http secure-port 443</pre>                                                                          | (Optional) Specifies the port number to be used for the HTTPS server. The default port number is 443. Valid options are 443 or any number in the range 1025 to 65535.                                                                                                                                    |
| <b>Step 5</b> | <p><b>ip http secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}</b></p> <p><b>Example:</b></p> <pre>Device(config)# ip http secure-ciphersuite rc4-128-md5</pre> | (Optional) Specifies the CipherSuites (encryption algorithms) to be used for encryption over the HTTPS connection. If you do not have a reason to specify a particular CipherSuite, you should allow the server and client to negotiate a CipherSuite that they both support. This is the default.       |
| <b>Step 6</b> | <p><b>ip http secure-client-auth</b></p> <p><b>Example:</b></p> <pre>Device(config)# ip http secure-client-auth</pre>                                                                            | (Optional) Configures the HTTP server to request an X.509v3 certificate from the client for authentication during the connection process. The default is for the client to request a certificate from the server, but the server does not attempt to authenticate the client.                            |

|                | Command or Action                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 7</b>  | <p><b>ip http secure-trustpoint</b> <i>name</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip http secure-trustpoint your_trustpoint</pre>                                            | <p>Specifies the CA trustpoint to use to get an X.509v3 security certificate and to authenticate the client certificate connection.</p> <p><b>Note</b> Use of this command assumes you have already configured a CA trustpoint according to the previous procedure.</p>                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 8</b>  | <p><b>ip http path</b> <i>path-name</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip http path /your_server:80</pre>                                                                 | (Optional) Sets a base HTTP path for HTML files. The path specifies the location of the HTTP server files on the local system (usually located in system flash memory).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 9</b>  | <p><b>ip http access-class</b> <i>access-list-number</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip http access-class 2</pre>                                                      | (Optional) Specifies an access list to use to allow access to the HTTP server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Step 10</b> | <p><b>ip http max-connections</b> <i>value</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip http max-connections 4</pre>                                                             | (Optional) Sets the maximum number of concurrent connections that are allowed to the HTTP server. We recommend that the value be at least 10 and not less. This is required for the UI to function as expected.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 11</b> | <p><b>ip http timeout-policy</b> <i>idle seconds life seconds requests value</i></p> <p><b>Example:</b></p> <pre>Device(config)# ip http timeout-policy idle 120 life 240 requests 1</pre> | <p>(Optional) Specifies how long a connection to the HTTP server can remain open under the defined circumstances:</p> <ul style="list-style-type: none"> <li>• <b>idle</b>—the maximum time period when no data is received or response data cannot be sent. The range is 1 to 600 seconds. The default is 180 seconds (3 minutes).</li> <li>• <b>life</b>—the maximum time period from the time that the connection is established. The range is 1 to 86400 seconds (24 hours). The default is 180 seconds.</li> <li>• <b>requests</b>—the maximum number of requests processed on a persistent connection. The maximum value is 86400. The default is 1.</li> </ul> |
| <b>Step 12</b> | <p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>                                                                                                                    | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Configuring the Secure HTTP Client

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP client:

### Before you begin

The standard HTTP client and secure HTTP client are always enabled. A certificate authority is required for secure HTTP client certification. This procedure assumes that you have previously configured a CA trustpoint on the switch. If a CA trustpoint is not configured and the remote HTTPS server requires client authentication, connections to the secure HTTP client fail.

### SUMMARY STEPS

1. **configure terminal**
2. **ip http client secure-trustpoint *name***
3. **ip http client secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}**
4. **end**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                 |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                      | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>ip http client secure-trustpoint <i>name</i></b><br><b>Example:</b><br>Device(config)# <b>ip http client secure-trustpoint<br/>your_trustpoint</b>                                                  | (Optional) Specifies the CA trustpoint to be used if the remote HTTP server requests client authentication. Using this command assumes that you have already configured a CA trustpoint by using the previous procedure. The command is optional if client authentication is not needed or if a primary trustpoint has been configured. |
| <b>Step 3</b> | <b>ip http client secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}</b><br><b>Example:</b><br>Device(config)# <b>ip http client secure-ciphersuite<br/>rc4-128-md5</b> | (Optional) Specifies the CipherSuites (encryption algorithms) to be used for encryption over the HTTPS connection. If you do not have a reason to specify a particular CipherSuite, you should allow the server and client to negotiate a CipherSuite that they both support. This is the default.                                      |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                                                            | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                        |

# Monitoring Secure HTTP Server and Client Status

To monitor the SSL secure server and client status, use the privileged EXEC commands in the following table.

*Table 133: Commands for Displaying the SSL Secure Server and Client Status*

| Command                                  | Purpose                                                                  |
|------------------------------------------|--------------------------------------------------------------------------|
| <b>show ip http client secure status</b> | Shows the HTTP secure client configuration.                              |
| <b>show ip http server secure status</b> | Shows the HTTP secure server configuration.                              |
| <b>show running-config</b>               | Shows the generated self-signed certificate for secure HTTP connections. |

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Configuring IPv4 Access Control Lists

This section lists the prerequisites for configuring network security with access control lists (ACLs).

- On switches running the LAN base feature set, VLAN maps are not supported.

## Restrictions for Configuring IPv4 Access Control Lists

### General Network Security

The following are restrictions for configuring network security with ACLs:

- Not all commands that accept a numbered ACL accept a named ACL. ACLs for packet filters and route filters on interfaces can use a name. VLAN maps also accept a name.
- A standard ACL and an extended ACL cannot have the same name.
- Though visible in the command-line help strings, **appletalk** is not supported as a matching condition for the **deny** and **permit** MAC access-list configuration mode commands.
- ACL wildcard is not supported in downstream client policy.

### IPv4 ACL Network Interfaces

The following restrictions apply to IPv4 ACLs to network interfaces:

- When controlling access to an interface, you can use a named or numbered ACL.
- If you apply an ACL to a Layer 2 interface that is a member of a VLAN, the Layer 2 (port) ACL takes precedence over an input Layer 3 ACL applied to the VLAN interface or a VLAN map applied to the VLAN.
- If you apply an ACL to a Layer 3 interface and routing is not enabled on the switch, the ACL only filters packets that are intended for the CPU, such as SNMP, Telnet, or web traffic.
- If the **preauth\_ipv4\_acl** ACL is configured to filter packets, the ACL is removed after authentication.
- You do not have to enable routing to apply ACLs to Layer 2 interfaces.

---

**Note** By default, the router sends Internet Control Message Protocol (ICMP) unreachable messages when a packet is denied by an access group on a Layer 3 interface. These access-group denied packets are not dropped in hardware but are bridged to the switch CPU so that it can generate the ICMP-unreachable message. They do not generate ICMP unreachable messages. ICMP unreachable messages can be disabled on router ACLs with the **no ip unreachable** interface command.

---

### MAC ACLs on a Layer 2 Interface

After you create a MAC ACL, you can apply it to a Layer 2 interface to filter non-IP traffic coming in that interface. When you apply the MAC ACL, consider these guidelines:

- You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface. The IP access list filters only IP packets, and the MAC access list filters non-IP packets.
- A Layer 2 interface can have only one MAC access list. If you apply a MAC access list to a Layer 2 interface that has a MAC ACL configured, the new ACL replaces the previously configured one.

---

**Note** The **mac access-group** interface configuration command is only valid when applied to a physical Layer 2 interface. You cannot use the command on EtherChannel port channels.

---

### IP Access List Entry Sequence Numbering

- This feature does not support dynamic, reflexive, or firewall access lists.

## Information about Network Security with ACLs

This chapter describes how to configure network security on the switch by using access control lists (ACLs), which in commands and tables are also referred to as access lists.

### ACL Overview

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a router or switch and permit or deny packets crossing specified interfaces or VLANs. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the switch accepts or rejects the packets. Because the switch stops testing after the first match, the order of conditions in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet. The switch can use ACLs on all packets it forwards, including packets bridged within a VLAN.

You configure access lists on a router or Layer 3 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both.

### Access Control Entries

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies *permit* or *deny* and a set of conditions the packet must satisfy in order to match the ACE. The meaning of *permit* or *deny* depends on the context in which the ACL is used.

### ACL Supported Types

The switch supports IP ACLs and Ethernet (MAC) ACLs:

- IP ACLs filter IPv4 traffic, including TCP, User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP).
- Ethernet ACLs filter non-IP traffic.

This switch also supports quality of service (QoS) classification ACLs.

### Supported ACLs

The switch supports three types of ACLs to filter traffic:

- Port ACLs access-control traffic entering a Layer 2 interface. You can apply only one IP access list and one MAC access list to a Layer 2 interface.
- Router ACLs access-control routed traffic between VLANs and are applied to Layer 3 interfaces in a specific direction (inbound or outbound).
- VLAN ACLs or VLAN maps access-control all packets (bridged and routed). You can use VLAN maps to filter traffic between devices in the same VLAN. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv4. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets (routed or bridged) entering the VLAN are checked against the VLAN map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

## ACL Precedence

When VLAN maps, Port ACLs, and router ACLs are configured on the same switch, the filtering precedence, from greatest to least, is port ACL, router ACL, then VLAN map. The following examples describe simple use cases:

- When both an input port ACL and a VLAN map are applied, incoming packets received on ports with a port ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map
- When an input router ACL and input port ACL exist in a switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.
- When a VLAN map, input router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.
- When a VLAN map, output router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

## Port ACLs

Port ACLs are ACLs that are applied to Layer 2 interfaces on a switch. Port ACLs are supported only on physical interfaces and not on EtherChannel interfaces. Port ACLs can be applied to the interface in outbound and inbound direction. The following access lists are supported:

- Standard IP access lists using source addresses
- Extended IP access lists using source and destination addresses and optional protocol type information
- MAC extended access lists using source and destination MAC addresses and optional protocol type information

The switch examines ACLs on an interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In this way, ACLs control access to a network or to part of a network.

**Figure 93: Using ACLs to Control Traffic in a Network**

This is an example of using port ACLs to control access to a network when all workstations are in the same VLAN. ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but prevent Host B from accessing the same network. Port ACLs can only be applied to Layer 2 interfaces in the

inbound direction.

When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port. When you apply a port ACL to a port with voice VLAN, the ACL filters traffic on both data and voice VLANs.

With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.

**Note** You cannot apply more than one IP access list and one MAC access list to a Layer 2 interface. If an IP access list or MAC access list is already configured on a Layer 2 interface and you apply a new IP access list or MAC access list to the interface, the new ACL replaces the previously configured one.

## Router ACLs

You can apply router ACLs on switch virtual interfaces (SVIs), which are Layer 3 interfaces to VLANs; on physical Layer 3 interfaces; and on Layer 3 EtherChannel interfaces. You apply router ACLs on interfaces for specific directions (inbound or outbound). You can apply one router ACL in each direction on an interface.

The switch supports these access lists for IPv4 traffic:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

As with port ACLs, the switch examines ACLs associated with features configured on a given interface. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface

are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.

ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL, and can be used to control access to a network or to part of a network.

## VLAN Maps

Use VLAN ACLs or VLAN maps to access-control all traffic. You can apply VLAN maps to all packets that are routed into or out of a VLAN or are bridged within a VLAN in the switch or switch stack.

Use VLAN maps for security packet filtering. VLAN maps are not defined by direction (input or output).

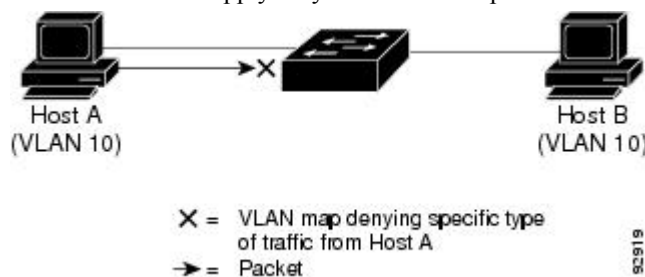

You can configure VLAN maps to match Layer 3 addresses for IPv4 traffic.

All non-IP protocols are access-controlled through MAC addresses and Ethertype using MAC VLAN maps. (IP traffic is not access controlled by MAC VLAN maps.) You can enforce VLAN maps only on packets going through the switch; you cannot enforce VLAN maps on traffic between hosts on a hub or on another switch connected to this switch.

With VLAN maps, forwarding of packets is permitted or denied, based on the action specified in the map.

**Figure 94: Using VLAN Maps to Control Traffic**

This shows how a VLAN map is applied to prevent a specific type of traffic from Host A in VLAN 10 from being forwarded. You can apply only one VLAN map to a

VLAN.

## ACEs and Fragmented and Unfragmented Traffic

IP packets can be fragmented as they cross the network. When this happens, only the fragment containing the beginning of the packet contains the Layer 4 information, such as TCP or UDP port numbers, ICMP type and code, and so on. All other fragments are missing this information.

Some access control entries (ACEs) do not check Layer 4 information and therefore can be applied to all packet fragments. ACEs that do test Layer 4 information cannot be applied in the standard manner to most of the fragments in a fragmented IP packet. When the fragment contains no Layer 4 information and the ACE tests some Layer 4 information, the matching rules are modified:

- Permit ACEs that check the Layer 3 information in the fragment (including protocol type, such as TCP, UDP, and so on) are considered to match the fragment regardless of what the missing Layer 4 information might have been.
- Deny ACEs that check Layer 4 information never match a fragment unless the fragment contains Layer 4 information.

## ACEs and Fragmented and Unfragmented Traffic Examples

Consider access list 102, configured with these commands, applied to three fragmented packets:

```
Device(config)# access-list 102 permit tcp any host 10.1.1.1 eq smtp
Device(config)# access-list 102 deny tcp any host 10.1.1.2 eq telnet
Device(config)# access-list 102 permit tcp any host 10.1.1.2
Device(config)# access-list 102 deny tcp any any
```

**Note** In the first and second ACEs in the examples, the *eq* keyword after the destination address means to test for the TCP-destination-port well-known numbers equaling Simple Mail Transfer Protocol (SMTP) and Telnet, respectively.

- Packet A is a TCP packet from host 10.2.2.2., port 65000, going to host 10.1.1.1 on the SMTP port. If this packet is fragmented, the first fragment matches the first ACE (a permit) as if it were a complete packet because all Layer 4 information is present. The remaining fragments also match the first ACE, even though they do not contain the SMTP port information, because the first ACE only checks Layer 3 information when applied to fragments. The information in this example is that the packet is TCP and that the destination is 10.1.1.1.
- Packet B is from host 10.2.2.2, port 65001, going to host 10.1.1.2 on the Telnet port. If this packet is fragmented, the first fragment matches the second ACE (a deny) because all Layer 3 and Layer 4 information is present. The remaining fragments in the packet do not match the second ACE because they are missing Layer 4 information. Instead, they match the third ACE (a permit).  
  
Because the first fragment was denied, host 10.1.1.2 cannot reassemble a complete packet, so packet B is effectively denied. However, the later fragments that are permitted will consume bandwidth on the network and resources of host 10.1.1.2 as it tries to reassemble the packet.
- Fragmented packet C is from host 10.2.2.2, port 65001, going to host 10.1.1.3, port ftp. If this packet is fragmented, the first fragment matches the fourth ACE (a deny). All other fragments also match the fourth ACE because that ACE does not check any Layer 4 information and because Layer 3 information in all fragments shows that they are being sent to host 10.1.1.3, and the earlier permit ACEs were checking different hosts.

## ACLs and Switch Stacks

ACL support is the same for a switch stack as for a standalone switch. ACL configuration information is propagated to all switches in the stack. All switches in the stack, including the active switch, process the information and program their hardware.

### Active Switch and ACL Functions

The active switch performs these ACL functions:

- It processes the ACL configuration and propagates the information to all stack members.
- It distributes the ACL information to any switch that joins the stack.
- If packets must be forwarded by software for any reason (for example, not enough hardware resources), the active switch forwards the packets only after applying ACLs on the packets.

- It programs its hardware with the ACL information it processes.

## Stack Member and ACL Functions

Stack members perform these ACL functions:

- They receive the ACL information from the active switch and program their hardware.
- A stack member configured as a standby switch, performs the functions of the active switch in the event the active switch fails.

## Active Switch Failure and ACLs

Both the active and standby switches have the ACL information. When the active switch fails, the standby takes over. The new active switch distributes the ACL information to all stack members.

## Standard and Extended IPv4 ACLs

This section describes IP ACLs.

An ACL is a sequential collection of permit and deny conditions. One by one, the switch tests packets against the conditions in an access list. The first match determines whether the switch accepts or rejects the packet. Because the switch stops testing after the first match, the order of the conditions is critical. If no conditions match, the switch denies the packet.

The software supports these types of ACLs or access lists for IPv4:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses for matching operations and optional protocol-type information for finer granularity of control.

## IPv4 ACL Switch Unsupported Features

Configuring IPv4 ACLs on the switch is the same as configuring IPv4 ACLs on other Cisco switches and routers.

The following ACL-related features are not supported:

- Non-IP protocol ACLs
- IP accounting
- Reflexive ACLs and dynamic ACLs are not supported.

## Access List Numbers

The number you use to denote your ACL shows the type of access list that you are creating.

This lists the access-list number and corresponding access list type and shows whether or not they are supported in the switch. The switch supports IPv4 standard and extended access lists, numbers 1 to 199 and 1300 to 2699.

**Table 134: Access List Numbers**

| Access List Number | Type                                     | Supported |
|--------------------|------------------------------------------|-----------|
| 1–99               | IP standard access list                  | Yes       |
| 100–199            | IP extended access list                  | Yes       |
| 200–299            | Protocol type-code access list           | No        |
| 300–399            | DECnet access list                       | No        |
| 400–499            | XNS standard access list                 | No        |
| 500–599            | XNS extended access list                 | No        |
| 600–699            | AppleTalk access list                    | No        |
| 700–799            | 48-bit MAC address access list           | No        |
| 800–899            | IPX standard access list                 | No        |
| 900–999            | IPX extended access list                 | No        |
| 1000–1099          | IPX SAP access list                      | No        |
| 1100–1199          | Extended 48-bit MAC address access list  | No        |
| 1200–1299          | IPX summary address access list          | No        |
| 1300–1999          | IP standard access list (expanded range) | Yes       |
| 2000–2699          | IP extended access list (expanded range) | Yes       |

In addition to numbered standard and extended ACLs, you can also create standard and extended named IP ACLs by using the supported numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

## Numbered Standard IPv4 ACLs

When creating an ACL, remember that, by default, the end of the ACL contains an implicit deny statement for all packets that it did not find a match for before reaching the end. With standard access lists, if you omit the mask from an associated IP host address ACL specification, 0.0.0.0 is assumed to be the mask.

The switch always rewrites the order of standard access lists so that entries with **host** matches and entries with matches having a *don't care* mask of 0.0.0.0 are moved to the top of the list, above any entries with

non-zero *don't care* masks. Therefore, in **show** command output and in the configuration file, the ACEs do not necessarily appear in the order in which they were entered.

After creating a numbered standard IPv4 ACL, you can apply it to VLANs, to terminal lines, or to interfaces.

## Numbered Extended IPv4 ACLs

Although standard ACLs use only source addresses for matching, you can use extended ACL source and destination addresses for matching operations and optional protocol type information for finer granularity of control. When you are creating ACEs in numbered extended access lists, remember that after you create the ACL, any additions are placed at the end of the list. You cannot reorder the list or selectively add or remove ACEs from a numbered list.

The switch does not support dynamic or reflexive access lists. It also does not support filtering based on the type of service (ToS) minimize-monetary-cost bit.

Some protocols also have specific parameters and keywords that apply to that protocol.

You can define an extended TCP, UDP, ICMP, IGMP, or other IP ACL. The switch also supports these IP protocols:

---

**Note** ICMP echo-reply cannot be filtered. All other ICMP codes or types can be filtered.

---

These IP protocols are supported:

- Authentication Header Protocol (**ahp**)
- Encapsulation Security Payload (**esp**)
- Enhanced Interior Gateway Routing Protocol (**eigrp**)
- generic routing encapsulation (**gre**)
- Internet Control Message Protocol (**icmp**)
- Internet Group Management Protocol (**igmp**)
- any Interior Protocol (**ip**)
- IP in IP tunneling (**ipinip**)
- KA9Q NOS-compatible IP over IP tunneling (**nos**)
- Open Shortest Path First routing (**ospf**)
- Payload Compression Protocol (**pcp**)
- Protocol-Independent Multicast (**pim**)
- Transmission Control Protocol (**tcp**)
- User Datagram Protocol (**udp**)

## Named IPv4 ACLs

You can identify IPv4 ACLs with an alphanumeric string (a name) rather than a number. You can use named ACLs to configure more IPv4 access lists in a router than if you were to use numbered access lists. If you

identify your access list with a name rather than a number, the mode and command syntax are slightly different. However, not all commands that use IP access lists accept a named access list.

---

**Note** The name you give to a standard or extended ACL can also be a number in the supported range of access list numbers. That is, the name of a standard IP ACL can be 1 to 99 and . The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

---

Consider these guidelines before configuring named ACLs:

- Numbered ACLs are also available.
- A standard ACL and an extended ACL cannot have the same name.
- You can use standard or extended ACLs (named or numbered) in VLAN maps.

## ACL Logging

The switch software can provide logging messages about packets permitted or denied by a standard IP access list. That is, any packet that matches the ACL causes an informational logging message about the packet to be sent to the console. The level of messages logged to the console is controlled by the **logging console** commands controlling the syslog messages.

---

**Note** Because routing is done in hardware and logging is done in software, if a large number of packets match a *permit* or *deny* ACE containing a **log** keyword, the software might not be able to match the hardware processing rate, and not all packets will be logged.

---

The first packet that triggers the ACL causes a logging message right away, and subsequent packets are collected over 5-minute intervals before they appear or logged. The logging message includes the access list number, whether the packet was permitted or denied, the source IP address of the packet, and the number of packets from that source permitted or denied in the prior 5-minute interval.

---

**Note** The logging facility might drop some logging message packets if there are too many to be handled or if there is more than one logging message to be handled in 1 second. This behavior prevents the router from crashing due to too many logging packets. Therefore, the logging facility should not be used as a billing tool or an accurate source of the number of matches to an access list.

---

## Hardware and Software Treatment of IP ACLs

ACL processing is performed in hardware. If the hardware reaches its capacity to store ACL configurations, all packets on that interface are dropped.

---

**Note** If an ACL configuration cannot be implemented in hardware due to an out-of-resource condition on a switch or stack member, then only the traffic in that VLAN arriving on that switch is affected.

---

For router ACLs, other factors can cause packets to be sent to the CPU:

- Using the **log** keyword
- Generating ICMP unreachable messages

When you enter the **show ip access-lists** privileged EXEC command, the match count displayed does not account for packets that are access controlled in hardware. Use the **show platform acl counters hardware** privileged EXEC command to obtain some basic hardware ACL statistics for switched and routed packets.

Router ACLs function as follows:

- The hardware controls permit and deny actions of standard and extended ACLs (input and output) for security access control.
- If **log** has not been specified, the flows that match a *deny* statement in a security ACL are dropped by the hardware if *ip unreachable* is disabled. The flows matching a *permit* statement are switched in hardware.
- Adding the **log** keyword to an ACE in a router ACL causes a copy of the packet to be sent to the CPU for logging only. If the ACE is a *permit* statement, the packet is still switched and routed in hardware.

## VLAN Map Configuration Guidelines

VLAN maps are the only way to control filtering within a VLAN. VLAN maps have no direction. To filter traffic in a specific direction by using a VLAN map, you need to include an ACL with specific source or destination addresses. If there is a match clause for that type of packet (IP or MAC) in the VLAN map, the default action is to drop the packet if the packet does not match any of the entries within the map. If there is no match clause for that type of packet, the default is to forward the packet.

The following are the VLAN map configuration guidelines:

- If there is no ACL configured to deny traffic on an interface and no VLAN map is configured, all traffic is permitted.
- Each VLAN map consists of a series of entries. The order of entries in an VLAN map is important. A packet that comes into the switch is tested against the first entry in the VLAN map. If it matches, the action specified for that part of the VLAN map is taken. If there is no match, the packet is tested against the next entry in the map.
- If the VLAN map has at least one match clause for the type of packet (IP or MAC) and the packet does not match any of these match clauses, the default is to drop the packet. If there is no match clause for that type of packet in the VLAN map, the default is to forward the packet.
- Logging is not supported for VLAN maps.
- When a switch has an IP access list or MAC access list applied to a Layer 2 interface, and you apply a VLAN map to a VLAN that the port belongs to, the port ACL takes precedence over the VLAN map.
- If a VLAN map configuration cannot be applied in hardware, all packets in that VLAN are dropped.

## VLAN Maps with Router ACLs

To access control both bridged and routed traffic, you can use VLAN maps only or a combination of router ACLs and VLAN maps. You can define router ACLs on both input and output routed VLAN interfaces, and you can define a VLAN map to access control the bridged traffic.

If a packet flow matches a VLAN-map deny clause in the ACL, regardless of the router ACL configuration, the packet flow is denied.

**Note** When you use router ACLs with VLAN maps, packets that require logging on the router ACLs are not logged if they are denied by a VLAN map.

If the VLAN map has a match clause for the type of packet (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map, and no action specified, the packet is forwarded if it does not match any VLAN map entry.

### VLAN Maps and Router ACL Configuration Guidelines

These guidelines are for configurations where you need to have an router ACL and a VLAN map on the same VLAN. These guidelines do not apply to configurations where you are mapping router ACLs and VLAN maps on different VLANs.

If you must configure a router ACL and a VLAN map on the same VLAN, use these guidelines for both router ACL and VLAN map configuration:

- You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.
- Whenever possible, try to write the ACL with all entries having a single action except for the final, default action of the other type. That is, write the ACL using one of these two forms:

```
permit... permit... permit... deny ip any any
```

or

```
deny... deny... deny... permit ip any any
```

- To define multiple actions in an ACL (permit, deny), group each action type together to reduce the number of entries.
- Avoid including Layer 4 information in an ACL; adding this information complicates the merging process. The best merge results are obtained if the ACLs are filtered based on IP addresses (source and destination) and not on the full flow (source IP address, destination IP address, protocol, and protocol ports). It is also helpful to use *don't care* bits in the IP address, whenever possible.

If you need to specify the full-flow mode and the ACL contains both IP ACEs and TCP/UDP/ICMP ACEs with Layer 4 information, put the Layer 4 ACEs at the end of the list. This gives priority to the filtering of traffic based on IP addresses.

## Time Ranges for ACLs

You can selectively apply extended ACLs based on the time of day and the week by using the **time-range** global configuration command. First, define a time-range name and set the times and the dates or the days of

the week in the time range. Then enter the time-range name when applying an ACL to set restrictions to the access list. You can use the time range to define when the permit or deny statements in the ACL are in effect, for example, during a specified time period or on specified days of the week. The **time-range** keyword and argument are referenced in the named and numbered extended ACL task tables.

These are some benefits of using time ranges:

- You have more control over permitting or denying a user access to resources, such as an application (identified by an IP address/mask pair and a port number).
- You can control logging messages. ACL entries can be set to log traffic only at certain times of the day. Therefore, you can simply deny access without needing to analyze many logs generated during peak hours.

Time-based access lists trigger CPU activity because the new configuration of the access list must be merged with other features and the combined configuration loaded into the hardware memory. For this reason, you should be careful not to have several access lists configured to take affect in close succession (within a small number of minutes of each other.)

---

**Note** The time range relies on the switch system clock; therefore, you need a reliable clock source. We recommend that you use Network Time Protocol (NTP) to synchronize the switch clock.

---

## IPv4 ACL Interface Considerations

When you apply the **ip access-group** interface configuration command to a Layer 3 interface (an SVI, a Layer 3 EtherChannel, or a routed port), the interface must have been configured with an IP address. Layer 3 access groups filter packets that are routed or are received by Layer 3 processes on the CPU. They do not affect packets bridged within a VLAN.

For inbound ACLs, after receiving a packet, the switch checks the packet against the ACL. If the ACL permits the packet, the switch continues to process the packet. If the ACL rejects the packet, the switch discards the packet.

For outbound ACLs, after receiving and routing a packet to a controlled interface, the switch checks the packet against the ACL. If the ACL permits the packet, the switch sends the packet. If the ACL rejects the packet, the switch discards the packet.

By default, the input interface sends ICMP Unreachable messages whenever a packet is discarded, regardless of whether the packet was discarded because of an ACL on the input interface or because of an ACL on the output interface. ICMP Unreachables are normally limited to no more than one every one-half second per input interface, but this can be changed by using the **ip icmp rate-limit unreachable** global configuration command.

When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied to the interface and permits all packets. Remember this behavior if you use undefined ACLs for network security.

# How to Configure ACLs

## Configuring IPv4 ACLs

These are the steps to use IP ACLs on the switch:

### SUMMARY STEPS

1. Create an ACL by specifying an access list number or name and the access conditions.
2. Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.

### DETAILED STEPS

|        | Command or Action                                                                                             | Purpose |
|--------|---------------------------------------------------------------------------------------------------------------|---------|
| Step 1 | Create an ACL by specifying an access list number or name and the access conditions.                          |         |
| Step 2 | Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps. |         |

## Creating a Numbered Standard ACL

Follow these steps to create a numbered standard ACL:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `access-list access-list-number {deny | permit} source source-wildcard [log]`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                              | Purpose                                                        |
|--------|--------------------------------------------------------------------------------|----------------------------------------------------------------|
| Step 1 | <p><code>enable</code></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre> | Enables privileged EXEC mode. Enter your password if prompted. |
| Step 2 | <p><code>configure terminal</code></p> <p><b>Example:</b></p>                  | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Creating a Numbered Extended ACL

Follow these steps to create a numbered extended ACL:

### SUMMARY STEPS

1. **configure terminal**
2. **access-list** *access-list-number* {deny | permit} *protocol source source-wildcard destination destination-wildcard* [precedence *precedence*] [tos *tos*] [fragments] [log [log-input] [time-range *time-range-name*] [dscp *dscp*]
3. **access-list** *access-list-number* {deny | permit} **tcp** *source source-wildcard* [*operator port*] *destination destination-wildcard* [*operator port*] [established] [precedence *precedence*] [tos *tos*] [fragments] [log [log-input] [time-range *time-range-name*] [dscp *dscp*] [*flag*]
4. **access-list** *access-list-number* {deny | permit} **udp** *source source-wildcard* [*operator port*] *destination destination-wildcard* [*operator port*] [precedence *precedence*] [tos *tos*] [fragments] [log [log-input] [time-range *time-range-name*] [dscp *dscp*]
5. **access-list** *access-list-number* {deny | permit} **icmp** *source source-wildcard destination destination-wildcard* [*icmp-type* | [[*icmp-type icmp-code*] | [*icmp-message*]]] [precedence *precedence*] [tos *tos*] [fragments] [log [log-input] [time-range *time-range-name*] [dscp *dscp*]
6. **access-list** *access-list-number* {deny | permit} **igmp** *source source-wildcard destination destination-wildcard* [*igmp-type*] [precedence *precedence*] [tos *tos*] [fragments] [log [log-input] [time-range *time-range-name*] [dscp *dscp*]
7. **end**

### DETAILED STEPS

|        | Command or Action                                                                                                                                                                                                                                                                                                                                                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                                                                                                                                                            | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Step 2 | <b>access-list</b> <i>access-list-number</i> {deny   permit} <i>protocol source source-wildcard destination destination-wildcard</i> [precedence <i>precedence</i> ] [tos <i>tos</i> ] [fragments] [log [log-input] [time-range <i>time-range-name</i> ] [dscp <i>dscp</i> ]<br><b>Example:</b><br>Device(config)# <b>access-list 101 permit ip host 10.1.1.2 any precedence 0 tos 0 log</b> | Defines an extended IPv4 access list and the access conditions.<br>The <i>access-list-number</i> is a decimal number from 100 to 199 or 2000 to 2699.<br>Enter <b>deny</b> or <b>permit</b> to specify whether to deny or permit the packet if conditions are matched.<br>For <i>protocol</i> , enter the name or number of an P protocol: <b>ahp</b> , <b>eigrp</b> , <b>esp</b> , <b>gre</b> , <b>icmp</b> , <b>igmp</b> , <b>igrp</b> , <b>ip</b> , <b>ipinip</b> , <b>nos</b> , <b>ospf</b> , <b>pcp</b> , <b>pim</b> , <b>tcp</b> , or <b>udp</b> , or an integer in the range 0 to 255 representing an IP protocol number. To match any Internet protocol (including ICMP, TCP, and UDP), use the keyword <b>ip</b> . |

|  | Command or Action | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |                   | <p><b>Note</b> This step includes options for most IP protocols. For additional specific parameters for TCP, UDP, ICMP, and IGMP, see the following steps.</p> <p>The <i>source</i> is the number of the network or host from which the packet is sent.</p> <p>The <i>source-wildcard</i> applies wildcard bits to the source.</p> <p>The <i>destination</i> is the network or host number to which the packet is sent.</p> <p>The <i>destination-wildcard</i> applies wildcard bits to the destination.</p> <p>Source, source-wildcard, destination, and destination-wildcard can be specified as:</p> <ul style="list-style-type: none"> <li>• The 32-bit quantity in dotted-decimal format.</li> <li>• The keyword <b>any</b> for 0.0.0.0 255.255.255.255 (any host).</li> <li>• The keyword <b>host</b> for a single host 0.0.0.0.</li> </ul> <p>The other keywords are optional and have these meanings:</p> <ul style="list-style-type: none"> <li>• <b>precedence</b>—Enter to match packets with a precedence level specified as a number from 0 to 7 or by name: <b>routine</b> (0), <b>priority</b> (1), <b>immediate</b> (2), <b>flash</b> (3), <b>flash-override</b> (4), <b>critical</b> (5), <b>internet</b> (6), <b>network</b> (7).</li> <li>• <b>fragments</b>—Enter to check non-initial fragments.</li> <li>• <b>tos</b>—Enter to match by type of service level, specified by a number from 0 to 15 or a name: <b>normal</b> (0), <b>max-reliability</b> (2), <b>max-throughput</b> (4), <b>min-delay</b> (8).</li> <li>• <b>log</b>—Enter to create an informational logging message to be sent to the console about the packet that matches the entry or <b>log-input</b> to include the input interface in the log entry.</li> <li>• <b>time-range</b>—Specify the time-range name.</li> <li>• <b>dscp</b>—Enter to match packets with the DSCP value specified by a number from 0 to 63, or use the question mark (?) to see a list of available values.</li> </ul> <p><b>Note</b> If you enter a <b>dscp</b> value, you cannot enter <b>tos</b> or <b>precedence</b>. You can enter both a <b>tos</b> and a <b>precedence</b> value with no <b>dscp</b>.</p> |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 3</b> | <p><b>access-list</b> <i>access-list-number</i> {deny   permit} <b>tcp</b> <i>source source-wildcard</i> [<i>operator port</i>] <i>destination destination-wildcard</i> [<i>operator port</i>] [<b>established</b>] [<b>precedence</b> <i>precedence</i>] [<b>tos</b> <i>tos</i>] [<b>fragments</b>] [<b>log</b>] [<b>log-input</b>] [<b>time-range</b> <i>time-range-name</i>] [<b>dscp</b> <i>dscp</i>] [<i>flag</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# access-list 101 permit tcp any any eq 500</pre> | <p>Defines an extended TCP access list and the access conditions.</p> <p>The parameters are the same as those described for an extended IPv4 ACL, with these exceptions:</p> <p>(Optional) Enter an <i>operator</i> and <i>port</i> to compare source (if positioned after <i>source source-wildcard</i>) or destination (if positioned after <i>destination destination-wildcard</i>) port. Possible operators include <b>eq</b> (equal), <b>gt</b> (greater than), <b>lt</b> (less than), <b>neq</b> (not equal), and <b>range</b> (inclusive range). Operators require a port number (range requires two port numbers separated by a space).</p> <p>Enter the <i>port</i> number as a decimal number (from 0 to 65535) or the name of a TCP port. Use only TCP port numbers or names when filtering TCP.</p> <p>The other optional keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• <b>established</b>—Enter to match an established connection. This has the same function as matching on the <b>ack</b> or <b>rst</b> flag.</li> <li>• <i>flag</i>—Enter one of these flags to match by the specified TCP header bits: <b>ack</b> (acknowledge), <b>fin</b> (finish), <b>psh</b> (push), <b>rst</b> (reset), <b>syn</b> (synchronize), or <b>urg</b> (urgent).</li> </ul> |
| <b>Step 4</b> | <p><b>access-list</b> <i>access-list-number</i> {deny   permit} <b>udp</b> <i>source source-wildcard</i> [<i>operator port</i>] <i>destination destination-wildcard</i> [<i>operator port</i>] [<b>precedence</b> <i>precedence</i>] [<b>tos</b> <i>tos</i>] [<b>fragments</b>] [<b>log</b>] [<b>log-input</b>] [<b>time-range</b> <i>time-range-name</i>] [<b>dscp</b> <i>dscp</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# access-list 101 permit udp any any eq 100</pre>                                    | <p>(Optional) Defines an extended UDP access list and the access conditions.</p> <p>The UDP parameters are the same as those described for TCP except that the [<i>operator</i> [<i>port</i>]] port number or name must be a UDP port number or name, and the <b>flag</b> and <b>established</b> keywords are not valid for UDP.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Creating Named Standard ACLs

Follow these steps to create a standard ACL using names:

**SUMMARY STEPS**

- enable**
- configure terminal**
- ip access-list standard** *name*
- Use one of the following:
  - deny** {*source* [*source-wildcard*] | **host** *source* | **any**} [**log**]
  - permit** {*source* [*source-wildcard*] | **host** *source* | **any**} [**log**]
- end**
- show running-config**
- copy running-config startup-config**

**DETAILED STEPS**

|               | Command or Action                           | Purpose                                                        |
|---------------|---------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <p><b>enable</b></p> <p><b>Example:</b></p> | Enables privileged EXEC mode. Enter your password if prompted. |

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Purpose                                                                                                                                                                                                                                                                                                                                                    |

|               | Device> <b>enable</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                      |
| <b>Step 3</b> | <b>ip access-list standard name</b><br><b>Example:</b><br>Device(config)# <b>ip access-list standard 20</b>                                                                                                                                                                                                                                                                                                                                                                                                                          | Defines a standard IPv4 access list using a name, and enter access-list configuration mode.<br><br>The name can be a number from 1 to 99.                                                                                                                                                                                                                  |
| <b>Step 4</b> | Use one of the following:<br><br><ul style="list-style-type: none"> <li>• <b>deny</b> {<i>source</i> [<i>source-wildcard</i>]   <b>host source</b>   <b>any</b>}<br/>[log]</li> <li>• <b>permit</b> {<i>source</i> [<i>source-wildcard</i>]   <b>host source</b>   <b>any</b>}<br/>[log]</li> </ul> <b>Example:</b><br><br>Device(config-std-nacl)# <b>deny 192.168.0.0</b><br><b>0.0.255.255 255.255.0.0 0.0.255.255</b><br><br>or<br><br>Device(config-std-nacl)# <b>permit 10.108.0.0 0.0.0.0</b><br><b>255.255.255.0 0.0.0.0</b> | In access-list configuration mode, specify one or more conditions denied or permitted to decide if the packet is forwarded or dropped.<br><br><ul style="list-style-type: none"> <li>• <b>host source</b>—A source and source wildcard of <i>source</i> 0.0.0.0.</li> <li>• <b>any</b>—A source and source wildcard of 0.0.0.0 255.255.255.255.</li> </ul> |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config-std-nacl)# <b>end</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                           |
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Verifies your entries.                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>                                                                                                                                                                                                                                                                                                                                                                                                                    | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                   |

## Creating Extended Named ACLs

Follow these steps to create an extended ACL using names:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip access-list extended *name***
4. **{deny | permit} protocol {source [source-wildcard] | host source | any} {destination [destination-wildcard] | host destination | any} [precedence precedence] [tos tos] [established] [log] [time-range time-range-name]**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                      | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                                                                                                                              | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                                                                      | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 3</b> | <b>ip access-list extended <i>name</i></b><br><b>Example:</b><br>Device(config)# <b>ip access-list extended 150</b>                                                                                                                                                                                    | Defines an extended IPv4 access list using a name, and enter access-list configuration mode.<br><br>The name can be a number from 100 to 199.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Step 4</b> | <b>{deny   permit} protocol {source [source-wildcard]   host source   any} {destination [destination-wildcard]   host destination   any} [precedence precedence] [tos tos] [established] [log] [time-range time-range-name]</b><br><b>Example:</b><br>Device(config-ext-nacl)# <b>permit 0 any any</b> | In access-list configuration mode, specify the conditions allowed or denied. Use the <b>log</b> keyword to get access list logging messages, including violations. <ul style="list-style-type: none"> <li>• <b>host source</b>—A source and source wildcard of <i>source</i> 0.0.0.0.</li> <li>• <b>host destination</b>—A destination and destination wildcard of <i>destination</i> 0.0.0.0.</li> <li>• <b>any</b>—A source and source wildcard or destination and destination wildcard of 0.0.0.0 255.255.255.255.</li> </ul> |

|        | Command or Action                                                                                                     | Purpose                                                  |
|--------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 5 | <b>end</b><br><b>Example:</b><br><pre>Device(config-ext-nacl)# end</pre>                                              | Returns to privileged EXEC mode.                         |
| Step 6 | <b>show running-config</b><br><b>Example:</b><br><pre>Device# show running-config</pre>                               | Verifies your entries.                                   |
| Step 7 | <b>copy running-config startup-config</b><br><b>Example:</b><br><pre>Device# copy running-config startup-config</pre> | (Optional) Saves your entries in the configuration file. |

When you are creating extended ACLs, remember that, by default, the end of the ACL contains an implicit deny statement for everything if it did not find a match before reaching the end. For standard ACLs, if you omit the mask from an associated IP host address access list specification, 0.0.0.0 is assumed to be the mask.

After you create an ACL, any additions are placed at the end of the list. You cannot selectively add ACL entries to a specific ACL. However, you can use **no permit** and **no deny** access-list configuration mode commands to remove entries from a named ACL.

Being able to selectively remove lines from a named ACL is one reason you might use named ACLs instead of numbered ACLs.

#### What to do next

After creating a named ACL, you can apply it to interfaces or to VLANs .

## Configuring Time Ranges for ACLs

Follow these steps to configure a time-range parameter for an ACL:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **time-range** *time-range-name*
4. Use one of the following:
  - **absolute** [*start time date*] [*end time date*]
  - **periodic** *day-of-the-week hh:mm to [day-of-the-week] hh:mm*
  - **periodic** {*weekdays* | *weekend* | *daily*} *hh:mm to hh:mm*
5. **end**
6. **show running-config**

## 7. copy running-config startup-config

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device(config)# <b>enable</b>                                                                                                                                                                                                                                                                                                                                                                                                                                          | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                                                                                                                                                                                                                                                                          | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <b>time-range</b> <i>time-range-name</i><br><b>Example:</b><br>Device(config)# <b>time-range</b> workhours                                                                                                                                                                                                                                                                                                                                                                                                 | Assigns a meaningful name (for example, <i>workhours</i> ) to the time range to be created, and enter time-range configuration mode. The name cannot contain a space or quotation mark and must begin with a letter.                                                                                                                                                                                                                                           |
| <b>Step 4</b> | Use one of the following: <ul style="list-style-type: none"> <li>• <b>absolute</b> [start <i>time date</i>] [end <i>time date</i>]</li> <li>• <b>periodic</b> <i>day-of-the-week hh:mm to [day-of-the-week] hh:mm</i></li> <li>• <b>periodic</b> {weekdays   weekend   daily} <i>hh:mm to hh:mm</i></li> </ul> <b>Example:</b><br>Device(config-time-range)# <b>absolute start</b> 00:00 1 Jan 2006 <b>end</b> 23:59 1 Jan 2006<br>or<br>Device(config-time-range)# <b>periodic weekdays</b> 8:00 to 12:00 | Specifies when the function it will be applied to is operational. <ul style="list-style-type: none"> <li>• You can use only one <b>absolute</b> statement in the time range. If you configure more than one absolute statement, only the one configured last is executed.</li> <li>• You can enter multiple <b>periodic</b> statements. For example, you could configure different hours for weekdays and weekends.</li> </ul> See the example configurations. |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config)# <b>end</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                | Returns to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Step 6</b> | <b>show running-config</b><br><b>Example:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|               | Command or Action                                                                                                       | Purpose                                                  |
|---------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
|               | Device# <code>show running-config</code>                                                                                |                                                          |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <code>copy running-config startup-config</code> | (Optional) Saves your entries in the configuration file. |

**What to do next**

Repeat the steps if you have multiple items that you want in effect at different times.

## Applying an IPv4 ACL to a Terminal Line

You can use numbered ACLs to control access to one or more terminal lines. You cannot apply named ACLs to lines. You must set identical restrictions on all the virtual terminal lines because a user can attempt to connect to any of them.

Follow these steps to restrict incoming and outgoing connections between a virtual terminal line and the addresses in an ACL:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `line [console | vty] line-number`
4. `access-class access-list-number {in | out}`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

**DETAILED STEPS**

|               | Command or Action                                                       | Purpose                                                        |
|---------------|-------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device(config)# <code>enable</code> | Enables privileged EXEC mode. Enter your password if prompted. |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b>                            | Enters the global configuration mode.                          |

|               | Command or Action                                                                                                                        | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | Device# <code>configure terminal</code>                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 3</b> | <p><code>line [console   vty] line-number</code></p> <p><b>Example:</b></p> <pre>Device(config)# line console 0</pre>                    | <p>Identifies a specific line to configure, and enter in-line configuration mode.</p> <ul style="list-style-type: none"> <li>• <b>console</b>—Specifies the console terminal line. The console port is DCE.</li> <li>• <b>vty</b>—Specifies a virtual terminal for remote console access.</li> </ul> <p>The <i>line-number</i> is the first line number in a contiguous group that you want to configure when the line type is specified. The range is from 0 to 16.</p> |
| <b>Step 4</b> | <p><code>access-class access-list-number {in   out}</code></p> <p><b>Example:</b></p> <pre>Device(config-line)# access-class 10 in</pre> | <p>Restricts incoming and outgoing connections between a particular virtual terminal line (into a device) and the addresses in an access list.</p>                                                                                                                                                                                                                                                                                                                       |
| <b>Step 5</b> | <p><code>end</code></p> <p><b>Example:</b></p> <pre>Device(config-line)# end</pre>                                                       | <p>Returns to privileged EXEC mode.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 6</b> | <p><code>show running-config</code></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>                                    | <p>Verifies your entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Step 7</b> | <p><code>copy running-config startup-config</code></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>      | <p>(Optional) Saves your entries in the configuration file.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |

## Applying an IPv4 ACL to an Interface

This section describes how to apply IPv4 ACLs to network interfaces.

Beginning in privileged EXEC mode, follow these steps to control access to an interface:

### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`

3. **ip access-group** {*access-list-number* | *name*} {**in** | **out**}
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                       | Purpose                                                                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                       | Enters the global configuration mode.                                                                                                                                                       |
| <b>Step 2</b> | <b>interface</b> <i>interface-id</i><br><b>Example:</b><br>Device(config)# <b>interface</b> <b>gigabitethernet1/0/1</b> | Identifies a specific interface for configuration, and enter interface configuration mode.<br><br>The interface can be a Layer 2 interface (port ACL), or a Layer 3 interface (router ACL). |
| <b>Step 3</b> | <b>ip access-group</b> { <i>access-list-number</i>   <i>name</i> } { <b>in</b>   <b>out</b> }                           | Controls access to the specified interface.<br><br>The <b>out</b> keyword is not supported for Layer 2 interfaces (port ACLs).                                                              |
| <b>Step 4</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <b>end</b>                                                          | Returns to privileged EXEC mode.                                                                                                                                                            |
| <b>Step 5</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                                     | Displays the access list configuration.                                                                                                                                                     |
| <b>Step 6</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b>       | (Optional) Saves your entries in the configuration file.                                                                                                                                    |

## Creating Named MAC Extended ACLs

You can filter non-IPv4 traffic on a VLAN or on a Layer 2 interface by using MAC addresses and named MAC extended ACLs. The procedure is similar to that of configuring other extended named ACLs.

Follow these steps to create a named MAC extended ACL:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mac access-list extended *name***
4. **{deny | permit} {any | host *source MAC address* | *source MAC address mask*} {any | host *destination MAC address* | *destination MAC address mask*} [*type mask* | **lsap** *lsap mask* | **aarp** | **amber** | **dec-spanning** | **decnet-iv** | **diagnostic** | **dsm** | **etype-6000** | **etype-8042** | **lat** | **lvc-sca** | **mop-console** | **mop-dump** | **msdos** | **mumps** | **netbios** | **vines-echo** | **vines-ip** | **xns-idp** | 0-65535] [**cos** *cos*]**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

### DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><pre>Device&gt; enable</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><pre>Device# configure terminal</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Step 3</b> | <b>mac access-list extended <i>name</i></b><br><b>Example:</b><br><pre>Device(config)# mac access-list extended mac1</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Defines an extended MAC access list using a name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Step 4</b> | <b>{deny   permit} {any   host <i>source MAC address</i>   <i>source MAC address mask</i>} {any   host <i>destination MAC address</i>   <i>destination MAC address mask</i>} [<i>type mask</i>   <b>lsap</b> <i>lsap mask</i>   <b>aarp</b>   <b>amber</b>   <b>dec-spanning</b>   <b>decnet-iv</b>   <b>diagnostic</b>   <b>dsm</b>   <b>etype-6000</b>   <b>etype-8042</b>   <b>lat</b>   <b>lvc-sca</b>   <b>mop-console</b>   <b>mop-dump</b>   <b>msdos</b>   <b>mumps</b>   <b>netbios</b>   <b>vines-echo</b>   <b>vines-ip</b>   <b>xns-idp</b>   0-65535] [<b>cos</b> <i>cos</i>]</b><br><b>Example:</b> | In extended MAC access-list configuration mode, specifies to <b>permit</b> or <b>deny</b> any source MAC address, a source MAC address with a mask, or a specific <b>host</b> source MAC address and <b>any</b> destination MAC address, destination MAC address with a mask, or a specific destination MAC address.<br>(Optional) You can also enter these options: <ul style="list-style-type: none"> <li>• <i>type mask</i>—An arbitrary EtherType number of a packet with Ethernet II or SNAP encapsulation in decimal,</li> </ul> |

## Applying a MAC ACL to a Layer 2 Interface

Follow these steps to apply a MAC access list to control access to a Layer 2 interface:

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **mac access-group** {*name*} {**in** | **out**}

5. `end`
6. `show mac access-group [interface interface-id]`
7. `show running-config`
8. `copy running-config startup-config`

## DETAILED STEPS

|               | Command or Action                                                                                                                                            | Purpose                                                                                                                                          |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <code>enable</code>                                                                                              | Enables privileged EXEC mode. Enter your password if prompted.                                                                                   |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                                                                      | Enters the global configuration mode.                                                                                                            |
| <b>Step 3</b> | <b>interface <i>interface-id</i></b><br><b>Example:</b><br>Device(config)# <code>interface gigabitethernet1/0/2</code>                                       | Identifies a specific interface, and enter interface configuration mode. The interface must be a physical Layer 2 interface (port ACL).          |
| <b>Step 4</b> | <b>mac access-group {<i>name</i>} {in   out }</b><br><b>Example:</b><br>Device(config-if)# <code>mac access-group mac1 in</code>                             | Controls access to the specified interface by using the MAC access list.<br><br>Port ACLs are supported in the outbound and inbound directions . |
| <b>Step 5</b> | <b>end</b><br><b>Example:</b><br>Device(config-if)# <code>end</code>                                                                                         | Returns to privileged EXEC mode.                                                                                                                 |
| <b>Step 6</b> | <b>show mac access-group [interface <i>interface-id</i>]</b><br><b>Example:</b><br>Device# <code>show mac access-group interface gigabitethernet1/0/2</code> | Displays the MAC access list applied to the interface or all Layer 2 interfaces.                                                                 |
| <b>Step 7</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <code>show running-config</code>                                                                    | Verifies your entries.                                                                                                                           |

|        | Command or Action                                                                                                 | Purpose                                                  |
|--------|-------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Step 8 | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file. |

After receiving a packet, the switch checks it against the inbound ACL. If the ACL permits it, the switch continues to process the packet. If the ACL rejects the packet, the switch discards it. When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied and permits all packets. Remember this behavior if you use undefined ACLs for network security.

## Configuring VLAN Maps

To create a VLAN map and apply it to one or more VLANs, perform these steps:

#### Before you begin

Create the standard or extended IPv4 ACLs or named MAC extended ACLs that you want to apply to the VLAN.

#### SUMMARY STEPS

1. **vlan access-map** *name* [**number**]
2. **match** {**ip** | **mac**} **address** {*name* | *number*} [*name* | *number*]
3. Enter one of the following commands to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs (standard or extended):

- **action** { **forward** }

```
Device(config-access-map)# action forward
```

- **action** { **drop** }

```
Device(config-access-map)# action drop
```

4. **vlan filter** *mapname* **vlan-list** *list*

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <p><b>vlan access-map</b> <i>name</i> [<i>number</i>]</p> <p><b>Example:</b></p> <pre>Device(config)# <b>vlan access-map map_1 20</b></pre>                                                                                                                                                                                                                                                                                                                                                | <p>Creates a VLAN map, and give it a name and (optionally) a number. The number is the sequence number of the entry within the map.</p> <p>When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete.</p> <p>VLAN maps do not use the specific permit or deny keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and set the action to drop. A permit in the ACL counts as a match. A deny in the ACL means no match.</p> <p>Entering this command changes to access-map configuration mode.</p> |
| <b>Step 2</b> | <p><b>match</b> {<b>ip</b>   <b>mac</b>} <b>address</b> {<i>name</i>   <i>number</i>} [<i>name</i>   <i>number</i>]</p> <p><b>Example:</b></p> <pre>Device(config-access-map)# <b>match ip address ip2</b></pre>                                                                                                                                                                                                                                                                           | <p>Match the packet (using either the IP or MAC address) against one or more standard or extended access lists. Note that packets are only matched against access lists of the correct protocol type. IP packets are matched against standard or extended IP access lists. Non-IP packets are only matched against named MAC extended access lists.</p> <p><b>Note</b> If the VLAN map is configured with a match clause for a type of packet (IP or MAC) and the map action is drop, all packets that match the type are dropped. If the VLAN map has no match clause, and the configured action is drop, all IP and Layer 2 packets are dropped.</p>                                          |
| <b>Step 3</b> | <p>Enter one of the following commands to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs (standard or extended):</p> <ul style="list-style-type: none"> <li>• <b>action</b> { <b>forward</b> }</li> </ul> <pre>Device(config-access-map)# <b>action forward</b></pre> <ul style="list-style-type: none"> <li>• <b>action</b> { <b>drop</b> }</li> </ul> <pre>Device(config-access-map)# <b>action drop</b></pre> | <p>Sets the action for the map entry.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Step 4</b> | <p><b>vlan filter</b> <i>mapname</i> <b>vlan-list</b> <i>list</i></p> <p><b>Example:</b></p>                                                                                                                                                                                                                                                                                                                                                                                               | <p>Applies the VLAN map to one or more VLAN IDs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|  | Command or Action                                              | Purpose                                                                                                                                                   |
|--|----------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Device(config)# <code>vlan filter map 1 vlan-list 20-22</code> | The list can be a single VLAN ID (22), a consecutive list (10-22), or a string of VLAN IDs (12, 22, 30). Spaces around the comma and hyphen are optional. |

## Creating a VLAN Map

Each VLAN map consists of an ordered series of entries. Beginning in privileged EXEC mode, follow these steps to create, add to, or delete a VLAN map entry:

### SUMMARY STEPS

1. `configure terminal`
2. `vlan access-map name [number]`
3. `match {ip | mac} address {name | number} [name | number]`
4. `action {drop | forward}`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

### DETAILED STEPS

|        | Command or Action                                                                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | <b>configure terminal</b><br><b>Example:</b><br>Device# <code>configure terminal</code>                          | Enters global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Step 2 | <b>vlan access-map name [number]</b><br><b>Example:</b><br>Device(config)# <code>vlan access-map map_1 20</code> | Creates a VLAN map, and give it a name and (optionally) a number. The number is the sequence number of the entry within the map.<br><br>When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete.<br><br>VLAN maps do not use the specific permit or deny keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and set the action to |

|               | Command or Action                                                                                                                                     | Purpose                                                                                                                                                                                                                                                                                                                                          |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |                                                                                                                                                       | drop. A permit in the ACL counts as a match. A deny in the ACL means no match.<br><br>Entering this command changes to access-map configuration mode.                                                                                                                                                                                            |
| <b>Step 3</b> | <b>match</b> {ip   mac} address {name   number} [name   number]<br><br><b>Example:</b><br><br>Device(config-access-map) # <b>match ip address ip2</b> | Match the packet (using either the IP or MAC address) against one or more standard or extended access lists. Note that packets are only matched against access lists of the correct protocol type. IP packets are matched against standard or extended IP access lists. Non-IP packets are only matched against named MAC extended access lists. |
| <b>Step 4</b> | <b>action</b> {drop   forward}<br><br><b>Example:</b><br><br>Device(config-access-map) # <b>action forward</b>                                        | (Optional) Sets the action for the map entry. The default is to forward.                                                                                                                                                                                                                                                                         |
| <b>Step 5</b> | <b>end</b><br><br><b>Example:</b><br><br>Device(config-access-map) # <b>end</b>                                                                       | Returns to global configuration mode.                                                                                                                                                                                                                                                                                                            |
| <b>Step 6</b> | <b>show running-config</b><br><br><b>Example:</b><br><br>Device# <b>show running-config</b>                                                           | Displays the access list configuration.                                                                                                                                                                                                                                                                                                          |
| <b>Step 7</b> | <b>copy running-config startup-config</b><br><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b>                             | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                         |

## Monitoring IPv4 ACLs

You can monitor IPv4 ACLs by displaying the ACLs that are configured on the switch, and displaying the ACLs that have been applied to interfaces and VLANs.

When you use the **ip access-group** interface configuration command to apply ACLs to a Layer 2 or 3 interface, you can display the access groups on the interface. You can also display the MAC ACLs applied to a Layer 2 interface. You can use the privileged EXEC commands as described in this table to display this information.

**Table 135: Commands for Displaying Access Lists and Access Groups**

| Command                                                               | Purpose                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>show access-lists</b> [ <i>number</i>   <i>name</i> ]              | Displays the contents of one or all current IP and MAC address access lists or a specific access list (numbered or named).                                                                                                                   |
| <b>show ip access-lists</b> [ <i>number</i>   <i>name</i> ]           | Displays the contents of all current IP access lists or a specific IP access list (numbered or named).                                                                                                                                       |
| <b>show ip interface</b> <i>interface-id</i>                          | Displays detailed configuration and status of an interface. If IP is enabled on the interface and ACLs have been applied by using the <b>ip access-group</b> interface configuration command, the access groups are included in the display. |
| <b>show running-config</b> [ <b>interface</b> <i>interface-id</i> ]   | Displays the contents of the configuration file for the switch or the specified interface, including all configured MAC and IP access lists and which access groups are applied to an interface.                                             |
| <b>show mac access-group</b> [ <b>interface</b> <i>interface-id</i> ] | Displays MAC access lists applied to all Layer 2 interfaces or the specified Layer 2 interface.                                                                                                                                              |

## Configuration Examples for ACLs

### Examples: Using Time Ranges with ACLs

This example shows how to verify after you configure time ranges for *workhours* and to configure January 1, 2006, as a company holiday.

```
Device# show time-range
time-range entry: new_year_day_2003 (inactive)
 absolute start 00:00 01 January 2006 end 23:59 01 January 2006
time-range entry: workhours (inactive)
 periodic weekdays 8:00 to 12:00
 periodic weekdays 13:00 to 17:00
```

To apply a time range, enter the time-range name in an extended ACL that can implement time ranges. This example shows how to create and verify extended access list 188 that denies TCP traffic from any source to any destination during the defined holiday times and permits all TCP traffic during work hours.

```
Device(config)# access-list 188 deny tcp any any time-range new_year_day_2006
Device(config)# access-list 188 permit tcp any any time-range workhours
```

```
Device(config)# end
Device# show access-lists
Extended IP access list 188
 10 deny tcp any any time-range new_year_day_2006 (inactive)
 20 permit tcp any any time-range workhours (inactive)
```

This example uses named ACLs to permit and deny the same traffic.

```
Device(config)# ip access-list extended deny_access
Device(config-ext-nacl)# deny tcp any any time-range new_year_day_2006
Device(config-ext-nacl)# exit
Device(config)# ip access-list extended may_access
Device(config-ext-nacl)# permit tcp any any time-range workhours
Device(config-ext-nacl)# end
Device# show ip access-lists
Extended IP access list lpip_default
 10 permit ip any any
Extended IP access list deny_access
 10 deny tcp any any time-range new_year_day_2006 (inactive)
Extended IP access list may_access
 10 permit tcp any any time-range workhours (inactive)
```

## Examples: Including Comments in ACLs

You can use the **remark** keyword to include comments (remarks) about entries in any IP standard or extended ACL. The remarks make the ACL easier for you to understand and scan. Each remark line is limited to 100 characters.

The remark can go before or after a permit or deny statement. You should be consistent about where you put the remark so that it is clear which remark describes which permit or deny statement. For example, it would be confusing to have some remarks before the associated permit or deny statements and some remarks after the associated statements.

To include a comment for IP numbered standard or extended ACLs, use the **access-list access-list number remark remark** global configuration command. To remove the remark, use the **no** form of this command.

In this example, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

```
Device(config)# access-list 1 remark Permit only Jones workstation through
Device(config)# access-list 1 permit 171.69.2.88
Device(config)# access-list 1 remark Do not allow Smith through
Device(config)# access-list 1 deny 171.69.3.13
```

For an entry in a named IP ACL, use the **remark access-list** configuration command. To remove the remark, use the **no** form of this command.

In this example, the Jones subnet is not allowed to use outbound Telnet:

```
Device(config)# ip access-list extended telnetting
Device(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Device(config-ext-nacl)# deny tcp host 171.69.2.88 any eq telnet
```

## IPv4 ACL Configuration Examples

This section provides examples of configuring and applying IPv4 ACLs. For detailed information about compiling ACLs, see the *Cisco IOS Security Configuration Guide, Release 12.4* and to the “Configuring IP Services” section in the “IP Addressing and Services” chapter of the *Cisco IOS IP Configuration Guide, Release 12.4*.

### ACLs in a Small Networked Office

*Figure 95: Using Router ACLs to Control Traffic*

This shows a small networked office environment with routed Port 2 connected to Server A, containing benefits and other information that all employees can access, and routed Port 1 connected to Server B, containing confidential payroll data. All users can access Server A, but Server B has restricted

access.

Use router ACLs to do this in one of two ways:

- Create a standard ACL, and filter traffic coming to the server from Port 1.
- Create an extended ACL, and filter traffic coming from the server into Port 1.

### Examples: ACLs in a Small Networked Office

This example uses a standard ACL to filter traffic coming into Server B from a port, permitting traffic only from Accounting’s source addresses 172.20.128.64 to 172.20.128.95. The ACL is applied to traffic coming out of routed Port 1 from the specified source address.

```
Device(config)# access-list 6 permit 172.20.128.64 0.0.0.31
Device(config)# end
Device# show access-lists
Standard IP access list 6
 10 permit 172.20.128.64, wildcard bits 0.0.0.31
```

```
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 6 out
```

This example uses an extended ACL to filter traffic coming from Server B into a port, permitting traffic from any source address (in this case Server B) to only the Accounting destination addresses 172.20.128.64 to 172.20.128.95. The ACL is applied to traffic going into routed Port 1, permitting it to go only to the specified destination addresses. Note that with extended ACLs, you must enter the protocol (IP) before the source and destination information.

```
Device(config)# access-list 106 permit ip any 172.20.128.64 0.0.0.31
Device(config)# end
Device# show access-lists
Extended IP access list 106
 10 permit ip any 172.20.128.64 0.0.0.31
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 106 in
```

## Example: Numbered ACLs

In this example, network 36.0.0.0 is a Class A network whose second octet specifies a subnet; that is, its subnet mask is 255.255.0.0. The third and fourth octets of a network 36.0.0.0 address specify a particular host. Using access list 2, the switch accepts one address on subnet 48 and reject all others on that subnet. The last line of the list shows that the switch accepts addresses on all other network 36.0.0.0 subnets. The ACL is applied to packets entering a port.

```
Device(config)# access-list 2 permit 36.48.0.3
Device(config)# access-list 2 deny 36.48.0.0 0.0.255.255
Device(config)# access-list 2 permit 36.0.0.0 0.255.255.255
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# ip access-group 2 in
```

## Examples: Extended ACLs

In this example, the first line permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 128.88.1.2. The third line permits incoming ICMP messages for error feedback.

```
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 gt 1023
Device(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Device(config)# access-list 102 permit icmp any any
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# ip access-group 102 in
```

In this example, suppose that you have a network connected to the Internet, and you want any host on the network to be able to form TCP connections to any host on the Internet. However, you do not want IP hosts to be able to form TCP connections to hosts on your network, except to the mail (SMTP) port of a dedicated mail host.

SMTP uses TCP port 25 on one end of the connection and a random port number on the other end. The same port numbers are used throughout the life of the connection. Mail packets coming in from the Internet have a destination port of 25. Outbound packets have the port numbers reversed. Because the secure system of the network always accepts mail connections on port 25, the incoming and outgoing services are separately

controlled. The ACL must be configured as an input ACL on the outbound interface and an output ACL on the inbound interface.

```
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 23
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 25
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 102 in
```

In this example, the network is a Class B network with the address 128.88.0.0, and the mail host address is 128.88.1.2. The **established** keyword is used only for the TCP to show an established connection. A match occurs if the TCP datagram has the ACK or RST bits set, which show that the packet belongs to an existing connection. Gigabit Ethernet interface 1 on stack member 1 is the interface that connects the router to the Internet.

```
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 established
Device(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 102 in
```

## Examples: Named ACLs

### Creating named standard and extended ACLs

This example creates a standard ACL named *internet\_filter* and an extended ACL named *marketing\_group*. The *internet\_filter* ACL allows all traffic from the source address 1.2.3.4.

```
Device(config)# ip access-list standard Internet_filter
Device(config-ext-nacl)# permit 1.2.3.4
Device(config-ext-nacl)# exit
```

The *marketing\_group* ACL allows any TCP Telnet traffic to the destination address and wildcard 171.69.0.0 0.0.255.255 and denies any other TCP traffic. It permits ICMP traffic, denies UDP traffic from any source to the destination address range 171.69.0.0 through 179.69.255.255 with a destination port less than 1024, denies any other IP traffic, and provides a log of the result.

```
Device(config)# ip access-list extended marketing_group
Device(config-ext-nacl)# permit tcp any 171.69.0.0 0.0.255.255 eq telnet
Device(config-ext-nacl)# deny tcp any any
Device(config-ext-nacl)# permit icmp any any
Device(config-ext-nacl)# deny udp any 171.69.0.0 0.0.255.255 lt 1024
Device(config-ext-nacl)# deny ip any any log
Device(config-ext-nacl)# exit
```

The *Internet\_filter* ACL is applied to outgoing traffic and the *marketing\_group* ACL is applied to incoming traffic on a Layer 3 port.

```
Device(config)# interface gigabitethernet3/0/2
Device(config-if)# no switchport
Device(config-if)# ip address 2.0.5.1 255.255.255.0
Device(config-if)# ip access-group Internet_filter out
Device(config-if)# ip access-group marketing_group in
```

### Deleting individual ACEs from named ACLs

This example shows how you can delete individual ACEs from the named access list *border-list*:

```
Device(config)# ip access-list extended border-list
Device(config-ext-nacl)# no permit ip host 10.1.1.3 any
```

## Examples: Time Range Applied to an IP ACL

This example denies HTTP traffic on IP on Monday through Friday between the hours of 8:00 a.m. and 6:00 p.m. (18:00). The example allows UDP traffic only on Saturday and Sunday from noon to 8:00 p.m. (20:00).

```
Device(config)# time-range no-http
Device(config)# periodic weekdays 8:00 to 18:00
!
Device(config)# time-range udp-yes
Device(config)# periodic weekend 12:00 to 20:00
!
Device(config)# ip access-list extended strict
Device(config-ext-nacl)# deny tcp any any eq www time-range no-http
Device(config-ext-nacl)# permit udp any any time-range udp-yes
!
Device(config-ext-nacl)# exit
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# ip access-group strict in
```

## Examples: Configuring Commented IP ACL Entries

In this example of a numbered ACL, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

```
Device(config)# access-list 1 remark Permit only Jones workstation through
Device(config)# access-list 1 permit 171.69.2.88
Device(config)# access-list 1 remark Do not allow Smith workstation through
Device(config)# access-list 1 deny 171.69.3.13
```

In this example of a numbered ACL, the Winter and Smith workstations are not allowed to browse the web:

```
Device(config)# access-list 100 remark Do not allow Winter to browse the web
Device(config)# access-list 100 deny host 171.69.3.85 any eq www
Device(config)# access-list 100 remark Do not allow Smith to browse the web
Device(config)# access-list 100 deny host 171.69.3.13 any eq www
```

In this example of a named ACL, the Jones subnet is not allowed access:

```
Device(config)# ip access-list standard prevention
Device(config-std-nacl)# remark Do not allow Jones subnet through
Device(config-std-nacl)# deny 171.69.0.0 0.0.255.255
```

In this example of a named ACL, the Jones subnet is not allowed to use outbound Telnet:

```
Device(config)# ip access-list extended telnetting
Device(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
```

```
Device(config-ext-nacl)# deny tcp 171.69.0.0 0.0.255.255 any eq telnet
```

## Examples: ACL Logging

Two variations of logging are supported on router ACLs. The **log** keyword sends an informational logging message to the console about the packet that matches the entry; the **log-input** keyword includes the input interface in the log entry.

In this example, standard named access list *stan1* denies traffic from 10.1.1.0 0.0.0.255, allows traffic from all other sources, and includes the **log** keyword.

```
Device(config)# ip access-list standard stan1
Device(config-std-nacl)# deny 10.1.1.0 0.0.0.255 log
Device(config-std-nacl)# permit any log
Device(config-std-nacl)# exit
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group stan1 in
Device(config-if)# end
Device# show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
 Console logging: level debugging, 37 messages logged
 Monitor logging: level debugging, 0 messages logged
 Buffer logging: level debugging, 37 messages logged
 File logging: disabled
 Trap logging: level debugging, 39 message lines logged
```

Log Buffer (4096 bytes):

```
00:00:48: NTP: authentication delay calculation problems
```

<output truncated>

```
00:09:34:%SEC-6-IPACCESSLOGS:list stan1 permitted 0.0.0.0 1 packet
00:09:59:%SEC-6-IPACCESSLOGS:list stan1 denied 10.1.1.15 1 packet
00:10:11:%SEC-6-IPACCESSLOGS:list stan1 permitted 0.0.0.0 1 packet
```

This example is a named extended access list *ext1* that permits ICMP packets from any source to 10.1.1.0 0.0.0.255 and denies all UDP packets.

```
Device(config)# ip access-list extended ext1
Device(config-ext-nacl)# permit icmp any 10.1.1.0 0.0.0.255 log
Device(config-ext-nacl)# deny udp any any log
Device(config-std-nacl)# exit
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip access-group ext1 in
```

This is an example of a log for an extended ACL:

```
01:24:23:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 1
packet
01:25:14:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 7
packets
01:26:12:%SEC-6-IPACCESSLOGDP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 1 packet
01:31:33:%SEC-6-IPACCESSLOGDP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 8 packets
```

Note that all logging entries for IP ACLs start with %SEC-6-IPACCESSLOG with minor variations in format depending on the kind of ACL and the access entry that has been matched.

This is an example of an output message when the **log-input** keyword is entered:

```
00:04:21:%SEC-6-IPACCESSLOGDP:list inputlog permitted icmp 10.1.1.10 (Vlan1 0001.42ef.a400)
->
10.1.1.61 (0/0), 1 packet
```

A log message for the same sort of packet using the **log** keyword does not include the input interface information:

```
00:05:47:%SEC-6-IPACCESSLOGDP:list inputlog permitted icmp 10.1.1.10 -> 10.1.1.61 (0/0), 1
packet
```

## Configuration Examples for ACLs and VLAN Maps

### Example: Creating an ACL and a VLAN Map to Deny a Packet

This example shows how to create an ACL and a VLAN map to deny a packet. In the first map, any packets that match the *ip1* ACL (TCP packets) would be dropped. You first create the *ip1* ACL to permit any TCP packet and no other packets. Because there is a match clause for IP packets in the VLAN map, the default action is to drop any IP packet that does not match any of the match clauses.

```
Device(config)# ip access-list extended ip1
Device(config-ext-nacl)# permit tcp any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map map_1 10
Device(config-access-map)# match ip address ip1
Device(config-access-map)# action drop
```

### Example: Creating an ACL and a VLAN Map to Permit a Packet

This example shows how to create a VLAN map to permit a packet. ACL *ip2* permits UDP packets and any packets that match the *ip2* ACL are forwarded. In this map, any IP packets that did not match any of the previous ACLs (that is, packets that are not TCP packets or UDP packets) would get dropped.

```
Device(config)# ip access-list extended ip2
Device(config-ext-nacl)# permit udp any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map map_1 20
Device(config-access-map)# match ip address ip2
Device(config-access-map)# action forward
```

### Example: Default Action of Dropping IP Packets and Forwarding MAC Packets

In this example, the VLAN map has a default action of drop for IP packets and a default action of forward for MAC packets. Used with standard ACL 101 and extended named access lists **igmp-match** and **tcp-match**, the map will have the following results:

- Forward all UDP packets
- Drop all IGMP packets

- Forward all TCP packets
- Drop all other IP packets
- Forward all non-IP packets

```

Device(config)# access-list 101 permit udp any any
Device(config)# ip access-list extended igmp-match
Device(config-ext-nacl)# permit igmp any any

Device(config)# action forward
Device(config-ext-nacl)# permit tcp any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map drop-ip-default 10
Device(config-access-map)# match ip address 101
Device(config-access-map)# action forward
Device(config-access-map)# exit
Device(config)# vlan access-map drop-ip-default 20
Device(config-access-map)# match ip address igmp-match
Device(config-access-map)# action drop
Device(config-access-map)# exit
Device(config)# vlan access-map drop-ip-default 30
Device(config-access-map)# match ip address tcp-match
Device(config-access-map)# action forward

```

## Example: Default Action of Dropping MAC Packets and Forwarding IP Packets

In this example, the VLAN map has a default action of drop for MAC packets and a default action of forward for IP packets. Used with MAC extended access lists **good-hosts** and **good-protocols**, the map will have the following results:

- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Forward MAC packets with decnet-iv or vines-ip protocols
- Drop all other non-IP packets
- Forward all IP packets

```

Device(config)# mac access-list extended good-hosts
Device(config-ext-macl)# permit host 000.0c00.0111 any
Device(config-ext-macl)# permit host 000.0c00.0211 any
Device(config-ext-nacl)# exit
Device(config)# action forward
Device(config-ext-macl)# mac access-list extended good-protocols
Device(config-ext-macl)# permit any any vines-ip
Device(config-ext-nacl)# exit
Device(config)# vlan access-map drop-mac-default 10
Device(config-access-map)# match mac address good-hosts
Device(config-access-map)# action forward
Device(config-access-map)# exit
Device(config)# vlan access-map drop-mac-default 20
Device(config-access-map)# match mac address good-protocols
Device(config-access-map)# action forward

```

## Example: Default Action of Dropping All Packets

In this example, the VLAN map has a default action of drop for all packets (IP and non-IP). Used with access lists **tcp-match** and **good-hosts** from Examples 2 and 3, the map will have the following results:

- Forward all TCP packets
- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Drop all other IP packets
- Drop all other MAC packets

```
Device(config)# vlan access-map drop-all-default 10
Device(config-access-map)# match ip address tcp-match
Device(config-access-map)# action forward
Device(config-access-map)# exit
Device(config)# vlan access-map drop-all-default 20
Device(config-access-map)# match mac address good-hosts
Device(config-access-map)# action forward
```

## Configuration Examples for Using VLAN Maps in Your Network

### Example: Wiring Closet Configuration

*Figure 96: Wiring Closet Configuration*

In a wiring closet configuration, routing might not be enabled on the switch. In this configuration, the switch can still support a VLAN map and a QoS classification ACL. Assume that Host X and Host Y are in different VLANs and are connected to wiring closet switches A and C. Traffic from Host X to Host Y is eventually being routed by Switch B, a Layer 3 switch with routing enabled. Traffic from Host X to Host Y can be access-controlled at the traffic entry point,

## Example: Restricting Access to a Server on Another VLAN

If you do not want HTTP traffic switched from Host X to Host Y, you can configure a VLAN map on Switch A to drop all HTTP traffic from Host X (IP address 10.1.1.32) to Host Y (IP address 10.1.1.34) at Switch A and not bridge it to Switch B.

First, define the IP access list *http* that permits (matches) any TCP traffic on the HTTP port.

```
Device(config)# ip access-list extended http
Device(config-ext-nacl)# permit tcp host 10.1.1.32 host 10.1.1.34 eq www
Device(config-ext-nacl)# exit
```

Next, create VLAN access map *map2* so that traffic that matches the *http* access list is dropped and all other IP traffic is forwarded.

```
Device(config)# vlan access-map map2 10
Device(config-access-map)# match ip address http
Device(config-access-map)# action drop
Device(config-access-map)# exit
Device(config)# ip access-list extended match_all
Device(config-ext-nacl)# permit ip any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map map2 20
Device(config-access-map)# match ip address match_all
Device(config-access-map)# action forward
```

Then, apply VLAN access map *map2* to VLAN 1.

```
Device(config)# vlan filter map2 vlan 1
```

## Example: Restricting Access to a Server on Another VLAN

**Figure 97: Restricting Access to a Server on Another VLAN**

You can restrict access to a server on another VLAN. For example, server 10.1.1.100 in VLAN 10 needs to have access denied to these hosts:

- Hosts in subnet 10.1.2.0/8 in VLAN 20 should not have access.
- Hosts 10.1.1.4 and 10.1.1.8 in VLAN 10 should not have access.

## Example: Denying Access to a Server on Another VLAN

This example shows how to deny access to a server on another VLAN by creating the VLAN map SERVER1 that denies access to hosts in subnet 10.1.2.0/24, host 10.1.1.4, and host 10.1.1.8 and permits other IP traffic. The final step is to apply the map SERVER1 to VLAN 10.

Define the IP ACL that will match the correct packets.

```
Device(config)# ip access-list extended SERVER1_ACL
Device(config-ext-nacl)# permit ip 10.1.2.0 0.0.0.255 host 10.1.1.100
Device(config-ext-nacl)# permit ip host 10.1.1.4 host 10.1.1.100
Device(config-ext-nacl)# permit ip host 10.1.1.8 host 10.1.1.100
Device(config-ext-nacl)# exit
```

Define a VLAN map using this ACL that will drop IP packets that match SERVER1\_ACL and forward IP packets that do not match the ACL.

```
Device(config)# vlan access-map SERVER1_MAP
Device(config-access-map)# match ip address SERVER1_ACL
Device(config-access-map)# action drop
Device(config)# vlan access-map SERVER1_MAP 20
Device(config-access-map)# action forward
Device(config-access-map)# exit
```

Apply the VLAN map to VLAN 10.

```
Device(config)# vlan filter SERVER1_MAP vlan-list 10
```

## Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs

This section gives examples of applying router ACLs and VLAN maps to a VLAN for switched, bridged, routed, and multicast packets. Although the following illustrations show packets being forwarded to their destination, each time the packet's path crosses a line indicating a VLAN map or an ACL, it is also possible that the packet might be dropped, rather than forwarded.

### Example: ACLs and Switched Packets

*Figure 98: Applying ACLs on Switched Packets*

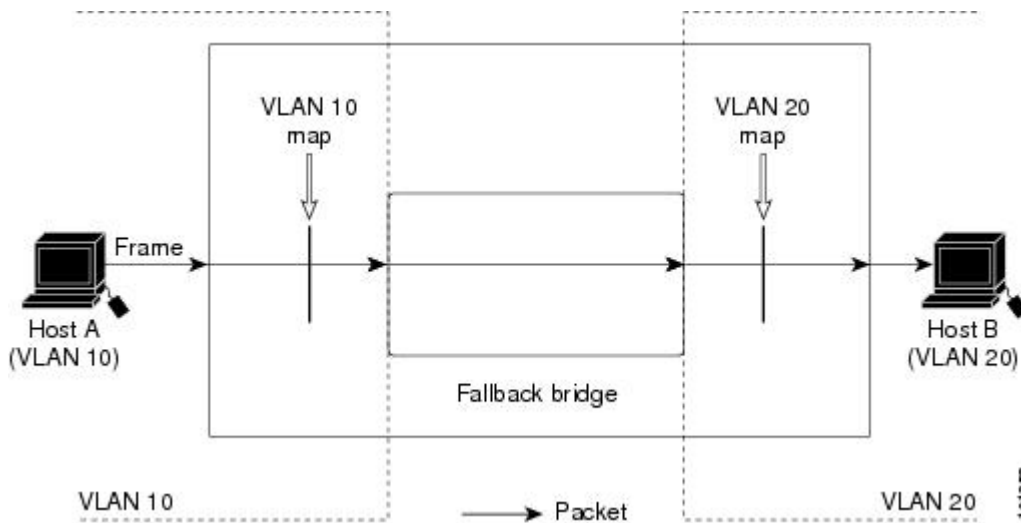

This example shows how an ACL is applied on packets that are switched within a VLAN. Packets switched within the VLAN without being routed or forwarded by fallback bridging are only subject to the VLAN map of the input VLAN.

## Example: ACLs and Bridged Packets

Figure 99: Applying ACLs on Bridged Packets

This example shows how an ACL is applied on fallback-bridged packets. For bridged packets, only Layer 2 ACLs are applied to the input VLAN. Only non-IP, non-ARP packets can be fallback-bridged.

## Example: ACLs and Routed Packets

Figure 100: Applying ACLs on Routed Packets

This example shows how ACLs are applied on routed packets. The ACLs are applied in this order:

1. VLAN map for input VLAN
2. Input router ACL

3. Output router ACL
4. VLAN map for output VLAN

## Example: ACLs and Multicast Packets

**Figure 101: Applying ACLs on Multicast Packets**

This example shows how ACLs are applied on packets that are replicated for IP multicasting. A multicast packet being routed has two different kinds of filters applied: one for destinations that are other ports in the input VLAN and another for each of the destinations that are in other VLANs to which the packet has been routed. The packet might be routed to more than one output VLAN, in which case a different router output ACL and VLAN map would apply for each destination VLAN. The final result is that the packet might be permitted in some of the output VLANs and not in others. A copy of the packet is forwarded to those destinations where it is permitted. However, if the input VLAN map drops the packet, no destination receives a copy of the packet.

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

### IPv6 ACLs Overview

You can filter IP Version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similarly to the way that you create and apply IP Version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic when the switch is running the IP base and LAN base feature sets.

A switch supports two types of IPv6 ACLs:

- IPv6 router ACLs are supported on outbound or inbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. IPv6 router ACLs apply only to IPv6 packets that are routed.
- IPv6 port ACLs are supported on inbound and outbound Layer 2 interfaces. IPv6 port ACLs are applied to all IPv6 packets entering the interface.

The switch does not support VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface. As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs.

## Switch Stacks and IPv6 ACLs

The active switch supports IPv6 ACLs in hardware and distributes the IPv6 ACLs to the stack members.

If a standby switch takes over as the active switch, it distributes the ACL configuration to all stack members. The member switches sync up the configuration distributed by the new active switch and flush out entries that are not required.

When an ACL is modified, attached to, or detached from an interface, the active switch distributes the change to all stack members.

## Interactions with Other Features and Switches

- If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.
- If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.
- You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

- You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.
- If the hardware memory is full, packets are dropped on the interface and an unload error message is logged.

## Restrictions for IPv6 ACLs

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The switch supports most Cisco IOS-supported IPv6 ACLs with some exceptions:

- The switch does not support matching on these keywords: **flowlabel**, **routing header**, and **undetermined-transport**.
- The switch does not support reflexive ACLs (the **reflect** keyword).
- This release supports only port ACLs and router ACLs for IPv6; it does not support VLAN ACLs (VLAN maps).
- The switch does not apply MAC-based ACLs on IPv6 frames.

- You cannot apply IPv6 port ACLs to Layer 2 EtherChannels.
- When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the switch checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.
- If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the switch does not allow the ACE to be added to the ACL that is currently attached to the interface.

IPv6 ACLs on the switch have these characteristics:

- Fragmented frames (the **fragments** keyword as in IPv4) are supported
- The same statistics supported in IPv4 are supported for IPv6 ACLs.
- If the switch runs out of hardware space, the packets associated with the ACL are dropped on the interface.
- Logging is supported for router ACLs, but not for port ACLs.
- The switch supports IPv6 address-matching for a full range of prefix-lengths.

## Default Configuration for IPv6 ACLs

The default IPv6 ACL configuration is as follows:

```
Switch# show access-lists preauth_ipv6_acl
IPv6 access list preauth_ipv6_acl (per-user)
permit udp any any eq domain sequence 10
permit tcp any any eq domain sequence 20
permit icmp any any nd-ns sequence 30
permit icmp any any nd-na sequence 40
permit icmp any any router-solicitation sequence 50
permit icmp any any router-advertisement sequence 60
permit icmp any any redirect sequence 70
permit udp any eq 547 any eq 546 sequence 80
permit udp any eq 546 any eq 547 sequence 90
deny ipv6 any any sequence 100
```

## Configuring IPv6 ACLs

To filter IPv6 traffic, you perform these steps:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **[no]{ipv6 access-list list-name} client permit-control-packets| log-update threshold| role-based list-name}**
4. **[no]{deny | permit} protocol {source-ipv6-prefix/prefix-length|any threshold| host source-ipv6-address} [ operator [ port-number ] ] { destination-ipv6-prefix/ prefix-length | any | host destination-ipv6-address}**

- [operator [port-number]][dscp value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]
5. {deny | permit} tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neg {port | protocol}] [psh] [range {port | protocol}] [rst] [routing] [sequence value] [syn] [time-range name] [urg]
  6. {deny | permit} udp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [dscp value] [log] [log-input] [neg {port | protocol}] [range {port | protocol}] [routing] [sequence value] [time-range name]
  7. {deny | permit} icmp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [icmp-type [icmp-code] | icmp-message] [dscp value] [log] [log-input] [routing] [sequence value] [time-range name]
  8. end
  9. show ipv6 access-list
  10. show running-config
  11. copy running-config startup-config

## DETAILED STEPS

|               | Command or Action                                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br>Device> <b>enable</b>                                                                                                                                                                                                                                                                                  | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br>Device# <b>configure terminal</b>                                                                                                                                                                                                                                                          | Enters the global configuration mode.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 3</b> | <b>[no]{ipv6 access-list list-name  client permit-control-packets  log-update threshold  role-based list-name}</b><br><b>Example:</b><br>Device (config)# <b>ipv6 access-list example_acl_list</b>                                                                                                                                         | Defines an IPv6 ACL name, and enters IPv6 access list configuration mode.                                                                                                                                                                                                                                                                                                                                                     |
| <b>Step 4</b> | <b>[no]{deny   permit} protocol {source-ipv6-prefix/prefix-length any threshold  host source-ipv6-address} [ operator [ port-number ]] { destination-ipv6-prefix/ prefix-length   any   host destination-ipv6-address} [operator [port-number]][dscp value] [fragments] [log] [log-input] [routing] [sequence value] [time-range name]</b> | Enter deny or permit to specify whether to deny or permit the packet if conditions are matched. These are the conditions: <ul style="list-style-type: none"> <li>• For protocol, enter the name or number of an Internet protocol: <b>ahp</b>, <b>esp</b>, <b>icmp</b>, <b>ipv6</b>, <b>pcp</b>, <b>stcp</b>, <b>tcp</b>, or <b>udp</b>, or an integer in the range 0 to 255 representing an IPv6 protocol number.</li> </ul> |

|  | Command or Action | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Step 8</b>  | <b>end</b>                                                                                                        | Return to privileged EXEC mode.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Step 9</b>  | <b>show ipv6 access-list</b>                                                                                      | Verify the access list configuration.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Step 10</b> | <b>show running-config</b><br><b>Example:</b><br>Device# <b>show running-config</b>                               | Verifies your entries.                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Step 11</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file.                                                                                                                                                                                                                                                                                                                                                                       |

**What to do next**

Attach the IPv6 ACL to an Interface

## Attaching an IPv6 ACL to an Interface

You can apply an ACL to outbound or inbound traffic on Layer 3 interfaces, or to inbound traffic on Layer 2 interfaces. You can also apply ACLs only to inbound management traffic on Layer 3 interfaces.

Follow these steps to control access to an interface:

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **no switchport**
5. **ipv6 address** *ipv6-address*
6. **ipv6 traffic-filter** *access-list-name* {in | out}
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

## DETAILED STEPS

|               | Command or Action                                                                                                     | Purpose                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step 1</b> | <b>enable</b><br><b>Example:</b><br><br>Device> <b>enable</b>                                                         | Enables privileged EXEC mode. Enter your password if prompted.                                                                                                |
| <b>Step 2</b> | <b>configure terminal</b><br><b>Example:</b><br><br>Device# <b>configure terminal</b>                                 | Enters the global configuration mode.                                                                                                                         |
| <b>Step 3</b> | <b>interface</b> <i>interface-id</i>                                                                                  | Identify a Layer 2 interface (for port ACLs) or Layer 3 interface (for router ACLs) on which to apply an access list, and enter interface configuration mode. |
| <b>Step 4</b> | <b>no switchport</b>                                                                                                  | If applying a router ACL, this changes the interface from Layer 2 mode (the default) to Layer 3 mode.                                                         |
| <b>Step 5</b> | <b>ipv6 address</b> <i>ipv6-address</i>                                                                               | Configure an IPv6 address on a Layer 3 interface (for router ACLs).                                                                                           |
| <b>Step 6</b> | <b>ipv6 traffic-filter</b> <i>access-list-name</i> { <b>in</b>   <b>out</b> }                                         | Apply the access list to incoming or outgoing traffic on the interface.                                                                                       |
| <b>Step 7</b> | <b>end</b><br><b>Example:</b><br><br>Device(config)# <b>end</b>                                                       | Returns to privileged EXEC mode.                                                                                                                              |
| <b>Step 8</b> | <b>show running-config</b><br><b>Example:</b><br><br>Device# <b>show running-config</b>                               | Verifies your entries.                                                                                                                                        |
| <b>Step 9</b> | <b>copy running-config startup-config</b><br><b>Example:</b><br><br>Device# <b>copy running-config startup-config</b> | (Optional) Saves your entries in the configuration file.                                                                                                      |

## Monitoring IPv6 ACLs

You can display information about all configured access lists, all IPv6 access lists, or a specific access list by using one or more of the privileged EXEC commands shown in the table below:

| Command                                                  | Purpose                                                                         |
|----------------------------------------------------------|---------------------------------------------------------------------------------|
| <b>show access-lists</b>                                 | Displays all access lists configured on the switch.                             |
| <b>show ipv6 access-list</b> [ <i>access-list-name</i> ] | Displays all configured IPv6 access lists or the access list specified by name. |

This is an example of the output from the `show access-lists` privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

```
Switch # show access-lists
Extended IP access list hello
 10 permit ip any any
IPv6 access list ipv6
 permit ipv6 any any sequence 10
```

This is an example of the output from the `show ipv6 access-list` privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

```
Switch# show ipv6 access-list
IPv6 access list inbound
 permit tcp any any eq bgp (8 matches) sequence 10
 permit tcp any any eq telnet (15 matches) sequence 20
 permit udp any any sequence 30

IPv6 access list outbound
 deny udp any any sequence 10
 deny tcp any any eq telnet sequence 20
```

## CHAPTER 85

# Configuring DHCP

---

- [Finding Feature Information, on page 1687](#)
- [Information About DHCP, on page 1687](#)
- [How to Configure DHCP Features, on page 1694](#)
- [Configuring DHCP Server Port-Based Address Allocation, on page 1704](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About DHCP

### DHCP Server

The DHCP server assigns IP addresses from specified address pools on a switch or router to DHCP clients and manages them. If the DHCP server cannot give the DHCP client the requested configuration parameters from its database, it forwards the request to one or more secondary DHCP servers defined by the network administrator. The switch can act as a DHCP server.

### DHCP Relay Agent

A DHCP relay agent is a Layer 3 device that forwards DHCP packets between clients and servers. Relay agents forward requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is different from the normal Layer 2 forwarding, in which IP datagrams are switched transparently between networks. Relay agents receive DHCP messages and generate new DHCP messages to send on output interfaces.

## DHCP Snooping

DHCP snooping is a DHCP security feature that provides network security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding database, also referred to as a DHCP snooping binding table.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. You use DHCP snooping to differentiate between untrusted interfaces connected to the end user and trusted interfaces connected to the DHCP server or another switch.

---

**Note** For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces.

---

An untrusted DHCP message is a message that is received through an untrusted interface. By default, the switch considers all interfaces untrusted. So, the switch must be configured to trust some interfaces to use DHCP Snooping. When you use DHCP snooping in a service-provider environment, an untrusted message is sent from a device that is not in the service-provider network, such as a customer's switch. Messages from unknown devices are untrusted because they can be sources of traffic attacks.

The DHCP snooping binding database has the MAC address, the IP address, the lease time, the binding type, the VLAN number, and the interface information that corresponds to the local untrusted interfaces of a switch. It does not have information regarding hosts interconnected with a trusted interface.

In a service-provider network, an example of an interface you might configure as trusted is one connected to a port on a device in the same network. An example of an untrusted interface is one that is connected to an untrusted interface in the network or to an interface on a device that is not in the network.

When a switch receives a packet on an untrusted interface and the interface belongs to a VLAN in which DHCP snooping is enabled, the switch compares the source MAC address and the DHCP client hardware address. If the addresses match (the default), the switch forwards the packet. If the addresses do not match, the switch drops the packet.

The switch drops a DHCP packet when one of these situations occurs:

- A packet from a DHCP server, such as a DHCP OFFER, DHCP ACK, DHCP NAK, or DHCP REQUEST packet, is received from outside the network or firewall.
- A packet is received on an untrusted interface, and the source MAC address and the DHCP client hardware address do not match.
- The switch receives a DHCP RELEASE or DHCP DECLINE broadcast message that has a MAC address in the DHCP snooping binding database, but the interface information in the binding database does not match the interface on which the message was received.
- A DHCP relay agent forwards a DHCP packet that includes a relay-agent IP address that is not 0.0.0.0, or the relay agent forwards a packet that includes option-82 information to an untrusted port.
- The maximum snooping queue size of 1000 is exceeded when DHCP snooping is enabled.

---

**Note** This is applicable from Cisco IOS XE Denali 16.1.x release onwards.

---

If the switch is an aggregation switch supporting DHCP snooping and is connected to an edge switch that is inserting DHCP option-82 information, the switch drops packets with option-82 information when packets are received on an untrusted interface. If DHCP snooping is enabled and packets are received on a trusted port, the aggregation switch does not learn the DHCP snooping bindings for connected devices and cannot build a complete DHCP snooping binding database.

When an aggregation switch can be connected to an edge switch through an untrusted interface and you enter the **ip dhcp snooping information option allow-untrusted** global configuration command, the aggregation switch accepts packets with option-82 information from the edge switch. The aggregation switch learns the bindings for hosts connected through an untrusted switch interface. The DHCP security features, such as dynamic ARP inspection or IP source guard, can still be enabled on the aggregation switch while the switch receives packets with option-82 information on untrusted input interfaces to which hosts are connected. The port on the edge switch that connects to the aggregation switch must be configured as a trusted interface.

Normally, it is not desirable to broadcast packets to wireless clients. So, DHCP snooping replaces destination broadcast MAC address (ffff.ffff.ffff) with unicast MAC address for DHCP packets that are going from server to wireless clients. The unicast MAC address is retrieved from CHADDR field in the DHCP payload. This processing is applied for server to client packets such as DHCP OFFER, DHCP ACK, and DHCP NACK messages. The **ip dhcp snooping wireless bootp-broadcast enable** can be used to revert this behavior. When the wireless BOOTP broadcast is enabled, the broadcast DHCP packets from server are forwarded to wireless clients without changing the destination MAC address.

#### Related Topics

[Prerequisites for Configuring DHCP Snooping and Option 82](#), on page 1699

## Option-82 Data Insertion

In residential, metropolitan Ethernet-access environments, DHCP can centrally manage the IP address assignments for a large number of subscribers. When the DHCP option-82 feature is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

---

**Note** The DHCP option-82 feature is supported only when DHCP snooping is globally enabled on the VLANs to which subscriber devices using option-82 are assigned.

---

The following illustration shows a metropolitan Ethernet network in which a centralized DHCP server assigns IP addresses to subscribers connected to the switch at the access layer. Because the DHCP clients and their associated DHCP server do not reside on the same IP network or subnet, a DHCP relay agent (the Catalyst switch) is configured with a helper address to enable broadcast forwarding and to transfer DHCP messages between the clients and the server.

Figure 102: DHCP Relay Agent in a Metropolitan Ethernet Network

When you enable the DHCP snooping information option 82 on the switch, the following sequence of events occurs:

- The host (DHCP client) generates a DHCP request and broadcasts it on the network.
- When the switch receives the DHCP request, it adds the option-82 information in the packet. By default, the remote-ID suboption is the switch MAC address, and the circuit-ID suboption is the port identifier, **vlan-mod-port**, from which the packet is received. You can configure the remote ID and circuit ID.
- If the IP address of the relay agent is configured, the switch adds this IP address in the DHCP packet.
- The switch forwards the DHCP request that includes the option-82 field to the DHCP server.
- The DHCP server receives the packet. If the server is option-82-capable, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.
- The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. The switch verifies that it originally inserted the option-82 data by inspecting the remote ID and possibly the circuit ID fields. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.

In the default suboption configuration, when the described sequence of events occurs, the values in these fields do not change (see the illustration, *Suboption Packet Formats*):

- Circuit-ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Circuit-ID type
  - Length of the circuit-ID type
- Remote-ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Remote-ID type

- Length of the remote-ID type

In the port field of the circuit ID suboption, the port numbers start at 3. For example, on a switch with 24 10/100/1000 ports and four small form-factor pluggable (SFP) module slots, port 3 is the Gigabit Ethernet 1/0/1 port, port 4 is the Gigabit Ethernet 1/0/2 port, and so forth. Port 27 is the SFP module slot Gigabit Ethernet 1/0/25, and so forth.

The illustration, *Suboption Packet Formats*, shows the packet formats for the remote-ID suboption and the circuit-ID suboption when the default suboption configuration is used. For the circuit-ID suboption, the module number corresponds to the switch number in the stack. The switch uses the packet formats when you globally enable DHCP snooping and enter the `ip dhcp snooping information option global` configuration command.

**Figure 103: Suboption Packet Formats**

#### Circuit ID Suboption Frame Format

#### Remote ID Suboption Frame Format

The illustration, *User-Configured Suboption Packet Formats*, shows the packet formats for user-configured remote-ID and circuit-ID suboptions. The switch uses these packet formats when DHCP snooping is globally enabled and when the `ip dhcp snooping information option format remote-id` global configuration command and the `ip dhcp snooping vlan information option format-type circuit-id string` interface configuration command are entered.

The values for these fields in the packets change from the default values when you configure the remote-ID and circuit-ID suboptions:

- Circuit-ID suboption fields
  - The circuit-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.
- Remote-ID suboption fields
  - The remote-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.

Figure 104: User-Configured Suboption Packet Formats

**Circuit ID Suboption Frame Format (for user-configured string):****Remote ID Suboption Frame Format (for user-configured string):**

## Cisco IOS DHCP Server Database

During the DHCP-based autoconfiguration process, the designated DHCP server uses the Cisco IOS DHCP server database. It has IP addresses, address bindings, and configuration parameters, such as the boot file.

An address binding is a mapping between an IP address and a MAC address of a host in the Cisco IOS DHCP server database. You can manually assign the client IP address, or the DHCP server can allocate an IP address from a DHCP address pool. For more information about manual and automatic address bindings, see the “Configuring DHCP” chapter of the *Cisco IOS IP Configuration Guide, Release 12.4*.

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the *Cisco IOS IP Configuration Guide, Release 12.4*.

## DHCP Snooping Binding Database

When DHCP snooping is enabled, the switch uses the DHCP snooping binding database to store information about untrusted interfaces. The database can have up to 64,000 bindings.

Each database entry (binding) has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. The database agent stores the bindings in a file at a configured location. At the end of each entry is a checksum that accounts for all the bytes from the start of the file through all the bytes associated with the entry. Each entry is 72 bytes, followed by a space and then the checksum value.

To keep the bindings when the switch reloads, you must use the DHCP snooping database agent. If the agent is disabled, dynamic ARP inspection or IP source guard is enabled, and the DHCP snooping binding database has dynamic bindings, the switch loses its connectivity. If the agent is disabled and only DHCP snooping is enabled, the switch does not lose its connectivity, but DHCP snooping might not prevent DHCP spoofing attacks.

When reloading, the switch reads the binding file to build the DHCP snooping binding database. The switch updates the file when the database changes.

When a switch learns of new bindings or when it loses bindings, the switch immediately updates the entries in the database. The switch also updates the entries in the binding file. The frequency at which the file is

updated is based on a configurable delay, and the updates are batched. If the file is not updated in a specified time (set by the write-delay and abort-timeout values), the update stops.

This is the format of the file with bindings:

```
<initial-checksum>
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
<entry-1> <checksum-1>
<entry-2> <checksum-1-2>
...
...
<entry-n> <checksum-1-2-...-n>
END
```

Each entry in the file is tagged with a checksum value that the switch uses to verify the entries when it reads the file. The initial-checksum entry on the first line distinguishes entries associated with the latest file update from entries associated with a previous file update.

This is an example of a binding file:

```
2bb4c2a1
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
192.1.168.1 3 0003.47d8.c91f 2BB6488E Gi1/0/4 21ae5fbb
192.1.168.3 3 0003.44d6.c52f 2BB648EB Gi1/0/4 1bdb223f
192.1.168.2 3 0003.47d9.c8f1 2BB648AB Gi1/0/4 584a38f0
END
```

When the switch starts and the calculated checksum value equals the stored checksum value, the switch reads entries from the binding file and adds the bindings to its DHCP snooping binding database. The switch ignores an entry when one of these situations occurs:

- The switch reads the entry and the calculated checksum value does not equal the stored checksum value. The entry and the ones following it are ignored.
- An entry has an expired lease time (the switch might not remove a binding entry when the lease time expires).
- The interface in the entry no longer exists on the system.
- The interface is a routed interface or a DHCP snooping-trusted interface.

## DHCP Snooping and Switch Stacks

DHCP snooping is managed on the stack master. When a new switch joins the stack, the switch receives the DHCP snooping configuration from the stack master. When a member leaves the stack, all DHCP snooping address bindings associated with the switch age out.

All snooping statistics are generated on the stack master. If a new stack master is elected, the statistics counters reset.

When a stack merge occurs, all DHCP snooping bindings in the stack master are lost if it is no longer the stack master. With a stack partition, the existing stack master is unchanged, and the bindings belonging to the

partitioned switches age out. The new master of the partitioned stack begins processing the new incoming DHCP packets.

# How to Configure DHCP Features

## Default DHCP Snooping Configuration

Table 136: Default DHCP Configuration

Feature	Default Setting
DHCP server	Enabled in Cisco IOS software, requires configuration <sup>13</sup>
DHCP relay agent	Enabled <sup>14</sup>
DHCP packet forwarding address	None configured
Checking the relay agent information	Enabled (invalid messages are dropped)
DHCP relay agent forwarding policy	Replace the existing relay agent information
DHCP snooping enabled globally	Disabled
DHCP snooping information option	Enabled
DHCP snooping option to accept packets on untrusted input interfaces <sup>15</sup>	Disabled
DHCP snooping limit rate	None configured
DHCP snooping trust	Untrusted
DHCP snooping VLAN	Disabled
DHCP snooping MAC address verification	Enabled
Cisco IOS DHCP server binding database	Enabled in Cisco IOS software, requires configuration. <b>Note</b> The switch gets network addresses and configuration parameters only from a device configured as a DHCP server.
DHCP snooping binding database agent	Enabled in Cisco IOS software, requires configuration. This feature is operational only when a destination is configured.

<sup>13</sup> The switch responds to DHCP requests only if it is configured as a DHCP server.

<sup>14</sup> The switch relays DHCP packets only if the IP address of the DHCP server is configured on the SVI of the DHCP client.

- <sup>15</sup> Use this feature when the switch is an aggregation switch that receives packets with option-82 information from an edge switch.

## DHCP Snooping Configuration Guidelines

- If a switch port is connected to a DHCP server, configure a port as trusted by entering the **ip dhcp snooping trust interface** configuration command.
- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the **no ip dhcp snooping trust** interface configuration command.
- You can display DHCP snooping statistics by entering the **show ip dhcp snooping statistics** user EXEC command, and you can clear the snooping statistics counters by entering the **clear ip dhcp snooping statistics** privileged EXEC command.

## Configuring the DHCP Server

The switch can act as a DHCP server.

For procedures to configure the switch as a DHCP server, see the “Configuring DHCP” section of the “IP addressing and Services” section of the *Cisco IOS IP Configuration Guide, Release 12.4*.

## DHCP Server and Switch Stacks

The DHCP binding database is managed on the stack master. When a new stack master is assigned, the new master downloads the saved binding database from the TFTP server. When a switchover happens, the new active stack master will use its database file that has been synced from the old active stack master using the SSO function. The IP addresses associated with the lost bindings are released. You should configure an automatic backup by using the **ip dhcp database url [timeout seconds | write-delay seconds]** global configuration command.

## Configuring the DHCP Relay Agent

Follow these steps to enable the DHCP relay agent on the switch:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **service dhcp**
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b>  Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>  Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>service dhcp</b> <b>Example:</b>  Device(config)# <b>service dhcp</b>	Enables the DHCP server and relay agent on your switch. By default, this feature is enabled.
<b>Step 4</b>	<b>end</b> <b>Example:</b>  Device(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b>  Device# <b>show running-config</b>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b>  Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

**What to do next**

See the “*Configuring DHCP*” section of the “IP Addressing and Services” section of the *Cisco IOS IP Configuration Guide, Release 12.4* for these procedures:

- Checking (validating) the relay agent information
- Configuring the relay agent forwarding policy

## Specifying the Packet Forwarding Address

If the DHCP server and the DHCP clients are on different networks or subnets, you must configure the switch with the **ip helper-address** *address* interface configuration command. The general rule is to configure the command on the Layer 3 interface closest to the client. The address used in the **ip helper-address** command can be a specific DHCP server IP address, or it can be the network address if other DHCP servers are on the destination network segment. Using the network address enables any DHCP server to respond to requests.

Beginning in privileged EXEC mode, follow these steps to specify the packet forwarding address:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface vlan** *vlan-id*
4. **ip address** *ip-address subnet-mask*
5. **ip helper-address** *address*
6. **end**
7. Use one of the following:
  - **interface range** *port-range*
  - **interface** *interface-id*
8. **switchport mode access**
9. **switchport access vlan** *vlan-id*
10. **end**
11. **show running-config**
12. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface vlan</b> <i>vlan-id</i> <b>Example:</b> Device(config)# <b>interface vlan 1</b>	Creates a switch virtual interface by entering a VLAN ID, and enter interface configuration mode.

	Command or Action	Purpose
<b>Step 4</b>	<b>ip address</b> <i>ip-address subnet-mask</i> <b>Example:</b> <pre>Device(config-if)# ip address 192.108.1.27 255.255.255.0</pre>	Configures the interface with an IP address and an IP subnet.
<b>Step 5</b>	<b>ip helper-address</b> <i>address</i> <b>Example:</b> <pre>Device(config-if)# ip helper-address 172.16.1.2</pre>	<p>Specifies the DHCP packet forwarding address.</p> <p>The helper address can be a specific DHCP server address, or it can be the network address if other DHCP servers are on the destination network segment. Using the network address enables other servers to respond to DHCP requests.</p> <p>If you have multiple servers, you can configure one helper address for each server.</p>
<b>Step 6</b>	<b>end</b> <b>Example:</b> <pre>Device(config-if)# end</pre>	Returns to global configuration mode.
<b>Step 7</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>interface range</b> <i>port-range</i></li> <li>• <b>interface</b> <i>interface-id</i></li> </ul> <b>Example:</b> <pre>Device(config)# interface gigabitethernet1/0/2</pre>	<p>Configures multiple physical ports that are connected to the DHCP clients, and enter interface range configuration mode.</p> <p>or</p> <p>Configures a single physical port that is connected to the DHCP client, and enter interface configuration mode.</p>
<b>Step 8</b>	<b>switchport mode access</b> <b>Example:</b> <pre>Device(config-if)# switchport mode access</pre>	Defines the VLAN membership mode for the port.
<b>Step 9</b>	<b>switchport access vlan</b> <i>vlan-id</i> <b>Example:</b> <pre>Device(config-if)# switchport access vlan 1</pre>	Assigns the ports to the same VLAN as configured in Step 2.
<b>Step 10</b>	<b>end</b> <b>Example:</b> <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 11</b>	<b>show running-config</b> <b>Example:</b> <pre>Device# show running-config</pre>	Verifies your entries.

	Command or Action	Purpose
Step 12	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Prerequisites for Configuring DHCP Snooping and Option 82

The prerequisites for DHCP Snooping and Option 82 are as follows:

- You must globally enable DHCP snooping on the switch.
- Before globally enabling DHCP snooping on the switch, make sure that the devices acting as the DHCP server and the DHCP relay agent are configured and enabled.
- If you want the switch to respond to DHCP requests, it must be configured as a DHCP server.
- Before configuring the DHCP snooping information option on your switch, be sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, or you must configure DHCP options for these devices.
- For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces. In a service-provider network, a trusted interface is connected to a port on a device in the same network.
- You must configure the switch to use the Cisco IOS DHCP server binding database to use it for DHCP snooping.
- To use the DHCP snooping option of accepting packets on untrusted inputs, the switch must be an aggregation switch that receives packets with option-82 information from an edge switch.
- The following prerequisites apply to DHCP snooping binding database configuration:
  - You must configure a destination on the DHCP snooping binding database to use the switch for DHCP snooping.
  - Because both NVRAM and the flash memory have limited storage capacity, we recommend that you store the binding file on a TFTP server.
  - For network-based URLs (such as TFTP and FTP), you must create an empty file at the configured URL before the switch can write bindings to the binding file at that URL. See the documentation for your TFTP server to determine whether you must first create an empty file on the server; some TFTP servers cannot be configured this way.
  - To ensure that the lease time in the database is accurate, we recommend that you enable and configure Network Time Protocol (NTP).
  - If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP.
- Before configuring the DHCP relay agent on your switch, make sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, configure DHCP options for devices, or set up the DHCP database agent.

- If you want the switch to relay DHCP packets, the IP address of the DHCP server must be configured on the switch virtual interface (SVI) of the DHCP client.
- If a switch port is connected to a DHCP server, configure a port as trusted by entering the **ip dhcp snooping trust interface** configuration command.
- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the **no ip dhcp snooping trust** interface configuration command.

## Enabling DHCP Snooping and Option 82

Follow these steps to enable DHCP snooping on the switch:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp snooping**
4. **ip dhcp snooping vlan *vlan-range***
5. **ip dhcp snooping information option**
6. **ip dhcp snooping information option format remote-id [string *ASCII-string* | hostname]**
7. **ip dhcp snooping information option allow-untrusted**
8. **ip dhcp snooping wireless bootp-broadcast enable (optional)**
9. **interface *interface-id***
10. **ip dhcp snooping vlan *vlan* information option format-type circuit-id [override] string *ASCII-string***
11. **ip dhcp snooping trust**
12. **ip dhcp snooping limit rate *rate***
13. **exit**
14. **ip dhcp snooping verify mac-address**
15. **end**
16. **show running-config**
17. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 3</b>	<b>ip dhcp snooping</b> <b>Example:</b> Device(config)# <code>ip dhcp snooping</code>	Enables DHCP snooping globally.
<b>Step 4</b>	<b>ip dhcp snooping vlan <i>vlan-range</i></b> <b>Example:</b> Device(config)# <code>ip dhcp snooping vlan 10</code>	Enables DHCP snooping on a VLAN or range of VLANs. The range is 1 to 4094. You can enter a single VLAN ID identified by VLAN ID number, a series of VLAN IDs separated by commas, a range of VLAN IDs separated by hyphens, or a range of VLAN IDs separated by entering the starting and ending VLAN IDs separated by a space. <ul style="list-style-type: none"> <li>You can enter a single VLAN ID identified by VLAN ID number, a series of VLAN IDs separated by commas, a range of VLAN IDs separated by hyphens, or a range of VLAN IDs separated by entering the starting and ending VLAN IDs separated by a space.</li> </ul>
<b>Step 5</b>	<b>ip dhcp snooping information option</b> <b>Example:</b> Device(config)# <code>ip dhcp snooping information option</code>	Enables the switch to insert and remove DHCP relay information (option-82 field) in forwarded DHCP request messages to the DHCP server. This is the default setting.
<b>Step 6</b>	<b>ip dhcp snooping information option format remote-id [string <i>ASCII-string</i>   hostname]</b> <b>Example:</b> Device(config)# <code>ip dhcp snooping information option format remote-id string acsiistring2</code>	(Optional) Configures the remote-ID suboption. You can configure the remote ID as: <ul style="list-style-type: none"> <li>String of up to 63 ASCII characters (no spaces)</li> <li>Configured hostname for the switch</li> </ul> <p><b>Note</b> If the hostname is longer than 63 characters, it is truncated to 63 characters in the remote-ID configuration.</p> <p>The default remote ID is the switch MAC address.</p>
<b>Step 7</b>	<b>ip dhcp snooping information option allow-untrusted</b> <b>Example:</b> Device(config)# <code>ip dhcp snooping information option allow-untrusted</code>	(Optional) If the switch is an aggregation switch connected to an edge switch, this command enables the switch to accept incoming DHCP snooping packets with option-82 information from the edge switch. The default setting is disabled. <p><b>Note</b> Enter this command only on aggregation switches that are connected to trusted devices.</p>

	Command or Action	Purpose
<b>Step 8</b>	<b>ip dhcp snooping wireless bootp-broadcast enable</b> <b>(optional)</b> <b>Example:</b>  Device(config)# <b>ip dhcp snooping wireless bootp-broadcast enable</b>	Enables broadcast address sent by the server to be retained by the switch when it forwards DHCP packets to wireless clients.
<b>Step 9</b>	<b>interface interface-id</b> <b>Example:</b>  Device(config)# <b>interface gigabitethernet2/0/1</b>	Specifies the interface to be configured, and enter interface configuration mode.
<b>Step 10</b>	<b>ip dhcp snooping vlan vlan information option format-type circuit-id [override] string ASCII-string</b> <b>Example:</b>  Device(config-if)# <b>ip dhcp snooping vlan 1 information option format-type circuit-id override string override2</b>	(Optional) Configures the circuit-ID suboption for the specified interface.  Specify the VLAN and port identifier, using a VLAN ID in the range of 1 to 4094. The default circuit ID is the port identifier, in the format <b>vlan-mod-port</b> . You can configure the circuit ID to be a string of 3 to 63 ASCII characters (no spaces). (Optional) Use the <b>override</b> keyword when you do not want the circuit-ID suboption inserted in TLV format to define subscriber information.
<b>Step 11</b>	<b>ip dhcp snooping trust</b> <b>Example:</b>  Device(config-if)# <b>ip dhcp snooping trust</b>	(Optional) Configures the interface as trusted or untrusted. Use the <b>no</b> keyword to configure an interface to receive messages from an untrusted client. The default setting is untrusted.
<b>Step 12</b>	<b>ip dhcp snooping limit rate rate</b> <b>Example:</b>  Device(config-if)# <b>ip dhcp snooping limit rate 100</b>	(Optional) Configures the number of DHCP packets per second that an interface can receive. The range is 1 to 2048. By default, no rate limit is configured.  <b>Note</b> We recommend an untrusted rate limit of not more than 100 packets per second. If you configure rate limiting for trusted interfaces, you might need to increase the rate limit if the port is a trunk port assigned to more than one VLAN with DHCP snooping.
<b>Step 13</b>	<b>exit</b> <b>Example:</b>  Device(config-if)# <b>exit</b>	Returns to global configuration mode.
<b>Step 14</b>	<b>ip dhcp snooping verify mac-address</b> <b>Example:</b>	(Optional) Configures the switch to verify that the source MAC address in a DHCP packet received on untrusted ports matches the client hardware address in the packet.

	Command or Action	Purpose
	Device(config)# <b>ip dhcp snooping verify mac-address</b>	The default is to verify that the source MAC address matches the client hardware address in the packet.
<b>Step 15</b>	<b>end</b>  <b>Example:</b>  Device(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 16</b>	<b>show running-config</b>  <b>Example:</b>  Device# <b>show running-config</b>	Verifies your entries.
<b>Step 17</b>	<b>copy running-config startup-config</b>  <b>Example:</b>  Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Enabling the Cisco IOS DHCP Server Database

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4

## Monitoring DHCP Snooping Information

*Table 137: Commands for Displaying DHCP Information*

<b>show ip dhcp snooping</b>	Displays the DHCP snooping configuration for a switch
<b>show ip dhcp snooping binding</b>	Displays only the dynamically configured bindings in the DHCP snooping binding database, also referred to as a binding table.
<b>show ip dhcp snooping database</b>	Displays the DHCP snooping binding database status and statistics.
<b>show ip dhcp snooping statistics</b>	Displays the DHCP snooping statistics in summary or detail form.
<b>show ip source binding</b>	Display the dynamically and statically configured bindings.

---

**Note** If DHCP snooping is enabled and an interface changes to the down state, the switch does not delete the statically configured bindings.

---

# Configuring DHCP Server Port-Based Address Allocation

## Information About Configuring DHCP Server Port-Based Address Allocation

DHCP server port-based address allocation is a feature that enables DHCP to maintain the same IP address on an Ethernet switch port regardless of the attached device client identifier or client hardware address.

When Ethernet switches are deployed in the network, they offer connectivity to the directly connected devices. In some environments, such as on a factory floor, if a device fails, the replacement device must be working immediately in the existing network. With the current DHCP implementation, there is no guarantee that DHCP would offer the same IP address to the replacement device. Control, monitoring, and other software expect a stable IP address associated with each device. If a device is replaced, the address assignment should remain stable even though the DHCP client has changed.

When configured, the DHCP server port-based address allocation feature ensures that the same IP address is always offered to the same connected port even as the client identifier or client hardware address changes in the DHCP messages received on that port. The DHCP protocol recognizes DHCP clients by the client identifier option in the DHCP packet. Clients that do not include the client identifier option are identified by the client hardware address. When you configure this feature, the port name of the interface overrides the client identifier or hardware address and the actual point of connection, the switch port, becomes the client identifier.

In all cases, by connecting the Ethernet cable to the same port, the same IP address is allocated through DHCP to the attached device.

The DHCP server port-based address allocation feature is only supported on a Cisco IOS DHCP server and not a third-party server.

## Default Port-Based Address Allocation Configuration

By default, DHCP server port-based address allocation is disabled.

## Port-Based Address Allocation Configuration Guidelines

- By default, DHCP server port-based address allocation is disabled.
- To restrict assignments from the DHCP pool to preconfigured reservations (unreserved addresses are not offered to the client and other clients are not served by the pool), you can enter the **reserved-only** DHCP pool configuration command.

## Enabling the DHCP Snooping Binding Database Agent

Beginning in privileged EXEC mode, follow these steps to enable and configure the DHCP snooping binding database agent on the switch:

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip dhcp snooping database** {**flash**[*number*]:/*filename* | **ftp**://*user:password@host/filename* | **http**://[*username:password@*]{*hostname* | *host-ip*}[/*directory*] /*image-name.tar* | **rcp**://*user@host/filename*} | **tftp**://*host/filename*
4. **ip dhcp snooping database timeout** *seconds*
5. **ip dhcp snooping database write-delay** *seconds*
6. **end**
7. **ip dhcp snooping binding** *mac-address* **vlan** *vlan-id* **ip-address** **interface** *interface-id* **expiry** *seconds*
8. **show ip dhcp snooping database** [**detail**]
9. **show running-config**
10. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 3	<b>ip dhcp snooping database</b> { <b>flash</b> [ <i>number</i> ]:/ <i>filename</i>   <b>ftp</b> :// <i>user:password@host/filename</i>   <b>http</b> ://[ <i>username:password@</i> ]{ <i>hostname</i>   <i>host-ip</i> }[/ <i>directory</i> ] / <i>image-name.tar</i>   <b>rcp</b> :// <i>user@host/filename</i> }   <b>tftp</b> :// <i>host/filename</i> <b>Example:</b> Device(config)# <b>ip dhcp snooping database</b> <b>tftp://10.90.90.90/snooping-rp2</b>	Specifies the URL for the database agent or the binding file by using one of these forms: <ul style="list-style-type: none"> <li>• <b>flash</b>[<i>number</i>]:/<i>filename</i></li> </ul> (Optional) Use the <i>number</i> parameter to specify the stack member number of the stack master. The range for <i>number</i> is 1 to 9. <ul style="list-style-type: none"> <li>• <b>ftp</b>://<i>user:password@host/filename</i></li> <li>• <b>http</b>://[<i>username:password@</i>]{<i>hostname</i>   <i>host-ip</i>}[/<i>directory</i>] /<i>image-name.tar</i></li> <li>• <b>rcp</b>://<i>user@host/filename</i></li> <li>• <b>tftp</b>://<i>host/filename</i></li> </ul>
Step 4	<b>ip dhcp snooping database timeout</b> <i>seconds</i> <b>Example:</b>	Specifies (in seconds) how long to wait for the database transfer process to finish before stopping the process.

	Command or Action	Purpose
	Device(config)# <code>ip dhcp snooping database timeout 300</code>	The default is 300 seconds. The range is 0 to 86400. Use 0 to define an infinite duration, which means to continue trying the transfer indefinitely.
<b>Step 5</b>	<b>ip dhcp snooping database write-delay <i>seconds</i></b> <b>Example:</b> Device(config)# <code>ip dhcp snooping database write-delay 15</code>	Specifies the duration for which the transfer should be delayed after the binding database changes. The range is from 15 to 86400 seconds. The default is 300 seconds (5 minutes).
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>ip dhcp snooping binding <i>mac-address</i> <i>vlan</i> <i>vlan-id</i> <i>ip-address</i> <i>interface</i> <i>interface-id</i> <i>expiry</i> <i>seconds</i></b> <b>Example:</b> Device# <code>ip dhcp snooping binding 0001.1234.1234 vlan 1 172.20.50.5 interface gil/1 expiry 1000</code>	(Optional) Adds binding entries to the DHCP snooping binding database. The <i>vlan-id</i> range is from 1 to 4904. The <i>seconds</i> range is from 1 to 4294967295.  Enter this command for each entry that you add.  Use this command when you are testing or debugging the switch.
<b>Step 8</b>	<b>show ip dhcp snooping database [detail]</b> <b>Example:</b> Device# <code>show ip dhcp snooping database detail</code>	Displays the status and statistics of the DHCP snooping binding database agent.
<b>Step 9</b>	<b>show running-config</b> <b>Example:</b> Device# <code>show running-config</code>	Verifies your entries.
<b>Step 10</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Enabling DHCP Server Port-Based Address Allocation

Follow these steps to globally enable port-based address allocation and to automatically generate a subscriber identifier on an interface.

### SUMMARY STEPS

1. enable

2. **configure terminal**
3. **ip dhcp use subscriber-id client-id**
4. **ip dhcp subscriber-id interface-name**
5. **interface *interface-id***
6. **ip dhcp server use subscriber-id client-id**
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip dhcp use subscriber-id client-id</b> <b>Example:</b> Device(config)# <b>ip dhcp use subscriber-id client-id</b>	Configures the DHCP server to globally use the subscriber identifier as the client identifier on all incoming DHCP messages.
<b>Step 4</b>	<b>ip dhcp subscriber-id interface-name</b> <b>Example:</b> Device(config)# <b>ip dhcp subscriber-id interface-name</b>	Automatically generates a subscriber identifier based on the short name of the interface.  A subscriber identifier configured on a specific interface takes precedence over this command.
<b>Step 5</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <b>interface gigabitethernet1/0/1</b>	Specifies the interface to be configured, and enter interface configuration mode.
<b>Step 6</b>	<b>ip dhcp server use subscriber-id client-id</b> <b>Example:</b> Device(config-if)# <b>ip dhcp server use subscriber-id client-id</b>	Configures the DHCP server to use the subscriber identifier as the client identifier on all incoming DHCP messages on the interface.

	Command or Action	Purpose
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 8</b>	<b>show running-config</b> <b>Example:</b> Device# <b>show running-config</b>	Verifies your entries.
<b>Step 9</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

### What to do next

After enabling DHCP port-based address allocation on the switch, use the **ip dhcp pool** global configuration command to preassign IP addresses and to associate them to clients.

## Monitoring DHCP Server Port-Based Address Allocation

*Table 138: Commands for Displaying DHCP Port-Based Address Allocation Information*

Command	Purpose
<b>show interface</b> <i>interface id</i>	Displays the status and configuration of a specific interface.
<b>show ip dhcp pool</b>	Displays the DHCP address pools.
<b>show ip dhcp binding</b>	Displays address bindings on the Cisco IOS DHCP server.

## CHAPTER 86

# Configuring IP Source Guard

IP Source Guard (IPSG) is a security feature that restricts IP traffic on nonrouted, Layer 2 interfaces by filtering traffic based on the DHCP snooping binding database and on manually configured IP source bindings.

This chapter contains the following topics:

- [Finding Feature Information, on page 1711](#)
- [Information About IP Source Guard, on page 1711](#)
- [How to Configure IP Source Guard, on page 1713](#)
- [Monitoring IP Source Guard, on page 1717](#)
- [Additional References, on page 1717](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About IP Source Guard

### IP Source Guard

You can use IP source guard to prevent traffic attacks if a host tries to use the IP address of its neighbor and you can enable IP source guard when DHCP snooping is enabled on an untrusted interface.

After IPSG is enabled on an interface, the switch blocks all IP traffic received on the interface except for DHCP packets allowed by DHCP snooping.

The switch uses a source IP lookup table in hardware to bind IP addresses to ports. For IP and MAC filtering, a combination of source IP and source MAC lookups are used. IP traffic with a source IP address in the binding table is allowed, all other traffic is denied.

The IP source binding table has bindings that are learned by DHCP snooping or are manually configured (static IP source bindings). An entry in this table has an IP address, its associated MAC address, and its associated VLAN number. The switch uses the IP source binding table only when IP source guard is enabled.

IPSG is supported only on Layer 2 ports, including access and trunk ports. You can configure IPSG with source IP address filtering or with source IP and MAC address filtering.

## IP Source Guard for Static Hosts

---

**Note** Do not use IPSG (IP source guard) for static hosts on uplink ports or trunk ports.

---

IPSG for static hosts extends the IPSG capability to non-DHCP and static environments. The previous IPSG used the entries created by DHCP snooping to validate the hosts connected to a switch. Any traffic received from a host without a valid DHCP binding entry is dropped. This security feature restricts IP traffic on nonrouted Layer 2 interfaces. It filters traffic based on the DHCP snooping binding database and on manually configured IP source bindings. The previous version of IPSG required a DHCP environment for IPSG to work.

IPSG for static hosts allows IPSG to work without DHCP. IPSG for static hosts relies on IP device tracking-table entries to install port ACLs. The switch creates static entries based on ARP requests or other IP packets to maintain the list of valid hosts for a given port. You can also specify the number of hosts allowed to send traffic to a given port. This is equivalent to port security at Layer 3.

IPSG for static hosts also supports dynamic hosts. If a dynamic host receives a DHCP-assigned IP address that is available in the IP DHCP snooping table, the same entry is learned by the IP device tracking table. In a stacked environment, when the master failover occurs, the IP source guard entries for static hosts attached to member ports are retained. When you enter the **show ip device tracking all EXEC** command, the IP device tracking table displays the entries as ACTIVE.

---

**Note** Some IP hosts with multiple network interfaces can inject some invalid packets into a network interface. The invalid packets contain the IP or MAC address for another network interface of the host as the source address. The invalid packets can cause IPSG for static hosts to connect to the host, to learn the invalid IP or MAC address bindings, and to reject the valid bindings. Consult the vendor of the corresponding operating system and the network interface to prevent the host from injecting invalid packets.

---

IPSG for static hosts initially learns IP or MAC bindings dynamically through an ACL-based snooping mechanism. IP or MAC bindings are learned from static hosts by ARP and IP packets. They are stored in the device tracking database. When the number of IP addresses that have been dynamically learned or statically configured on a given port reaches a maximum, the hardware drops any packet with a new IP address. To resolve hosts that have moved or gone away for any reason, IPSG for static hosts leverages IP device tracking to age out dynamically learned IP address bindings. This feature can be used with DHCP snooping. Multiple bindings are established on a port that is connected to both DHCP and static hosts. For example, bindings are stored in both the device tracking database as well as in the DHCP snooping binding database.

## IP Source Guard Configuration Guidelines

- You can configure static IP bindings only on nonrouted ports. If you enter the **ip source binding** *mac-address vlan vlan-id ip-address interface interface-id* global configuration command on a routed interface, this error message appears:

```
Static IP source binding can only be configured on switch port.
```

- When IP source guard with source IP filtering is enabled on an interface, DHCP snooping must be enabled on the access VLAN for that interface.
- If you are enabling IP source guard on a trunk interface with multiple VLANs and DHCP snooping is enabled on all the VLANs, the source IP address filter is applied on all the VLANs.

---

**Note** If IP source guard is enabled and you enable or disable DHCP snooping on a VLAN on the trunk interface, the switch might not properly filter traffic.

---

- You can enable this feature when 802.1x port-based authentication is enabled.
- When you configure IP source guard smart logging, packets with a source address other than the specified address or an address learned by DHCP are denied, and the packet contents are sent to a NetFlow collector. If you configure this feature, make sure that smart logging is globally enabled.
- In a switch stack, if IP source guard is configured on a stack member interface and you remove the configuration of that switch by entering the **no switch stack-member-number provision** global configuration command, the interface static bindings are removed from the binding table, but they are not removed from the running configuration. If you again provision the switch by entering the **switch stack-member-number provision** command, the binding is restored.

To remove the binding from the running configuration, you must disable IP source guard before entering the **no switch provision** command. The configuration is also removed if the switch reloads while the interface is removed from the binding table.

## How to Configure IP Source Guard

### Enabling IP Source Guard

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **ip verify source** [**mac-check** ]
5. **exit**
6. **ip source binding** *mac-address vlan vlan-id ip-address interface interface-id*
7. **end**

8. `show running-config`
9. `copy running-config startup-config`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <code>interface gigabitethernet 1/0/1</code>	Specifies the interface to be configured, and enters interface configuration mode.
<b>Step 4</b>	<b>ip verify source [mac-check ]</b> <b>Example:</b> Device(config-if)# <code>ip verify source</code>	Enables IP source guard with source IP address filtering.  (Optional) <b>mac-check</b> —Enables IP Source Guard with source IP address and MAC address filtering.
<b>Step 5</b>	<b>exit</b> <b>Example:</b> Device(config-if)# <code>exit</code>	Returns to global configuration mode.
<b>Step 6</b>	<b>ip source binding <i>mac-address</i> <i>vlan</i> <i>vlan-id</i> <i>ip-address</i></b> <b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <code>ip source binding 0100.0230.0002</code> <code>vlan 11 10.0.0.4 interface gigabitethernet1/0/1</code>	Adds a static IP source binding.  Enter this command for each static binding.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.

	Command or Action	Purpose
Step 8	<b>show running-config</b> <b>Example:</b> Device# <code>show running-config</code>	Verifies your entries.
Step 9	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Configuring IP Source Guard for Static Hosts on a Layer 2 Access Port

You must configure the `ip device tracking maximum limit-number` interface configuration command globally for IPSG for static hosts to work. If you only configure this command on a port without enabling IP device tracking globally or by setting an IP device tracking maximum on that interface, IPSG with static hosts rejects all the IP traffic from that interface.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip device tracking`
4. `interface interface-id`
5. `switchport mode access`
6. `switchport access vlan vlan-id`
7. `ip verify source[tracking] [mac-check ]`
8. `ip device tracking maximum number`
9. `end`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>ip device tracking</b> <b>Example:</b> <pre>Device(config)# ip device tracking</pre>	Turns on the IP host table, and globally enables IP device tracking.
<b>Step 4</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Device(config)# interface gigabitethernet 1/0/1</pre>	Enters interface configuration mode.
<b>Step 5</b>	<b>switchport mode access</b> <b>Example:</b> <pre>Device(config-if)# switchport mode access</pre>	Configures a port as access.
<b>Step 6</b>	<b>switchport access vlan <i>vlan-id</i></b> <b>Example:</b> <pre>Device(config-if)# switchport access vlan 10</pre>	Configures the VLAN for this port.
<b>Step 7</b>	<b>ip verify source[tracking] [mac-check ]</b> <b>Example:</b> <pre>Device(config-if)# ip verify source tracking mac-check</pre>	<p>Enables IP source guard with source IP address filtering.</p> <p>(Optional) <b>tracking</b>—Enables IP source guard for static hosts.</p> <p>(Optional) <b>mac-check</b>—Enables MAC address filtering.</p> <p>The command <b>ip verify source tracking mac-check</b> enables IP source guard for static hosts with MAC address filtering.</p>
<b>Step 8</b>	<b>ip device tracking maximum <i>number</i></b> <b>Example:</b> <pre>Device(config-if)# ip device tracking maximum 8</pre>	<p>Establishes a maximum limit for the number of static IPs that the IP device tracking table allows on the port. The range is 1 to 10. The maximum number is 10.</p> <p><b>Note</b> You must configure the <b>ip device tracking maximum <i>limit-number</i></b> interface configuration command.</p>
<b>Step 9</b>	<b>end</b> <b>Example:</b> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

# Monitoring IP Source Guard

Table 139: Privileged EXEC show Commands

Command	Purpose
<code>show ip verify source [ interface interface-id ]</code>	Displays the IP source guard configuration on the switch or on a specific interface.
<code>show ip device tracking { all   interface interface-id   ip ip-address   mac imac-address }</code>	Displays information about the entries in the IP device tracking table.

Table 140: Interface Configuration Commands

Command	Purpose
<code>ip verify source tracking</code>	Verifies the data source.

For detailed information about the fields in these displays, see the command reference for this release.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for Dynamic ARP Inspection

This section lists the restrictions and guidelines for configuring Dynamic ARP Inspection on the switch.

- Dynamic ARP inspection is an ingress security feature; it does not perform any egress checking.
- Dynamic ARP inspection is not effective for hosts connected to switches that do not support dynamic ARP inspection or that do not have this feature enabled. Because man-in-the-middle attacks are limited to a single Layer 2 broadcast domain, separate the domain with dynamic ARP inspection checks from the one with no checking. This action secures the ARP caches of hosts in the domain enabled for dynamic ARP inspection.

- Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

When DHCP snooping is disabled or in non-DHCP environments, use ARP ACLs to permit or to deny packets.

- Dynamic ARP inspection is supported on access ports, trunk ports, and EtherChannel ports.

---

**Note** Do not enable Dynamic ARP inspection on RSPAN VLANs. If Dynamic ARP inspection is enabled on RSPAN VLANs, Dynamic ARP inspection packets might not reach the RSPAN destination port.

---

- A physical port can join an EtherChannel port channel only when the trust state of the physical port and the channel port match. Otherwise, the physical port remains suspended in the port channel. A port channel inherits its trust state from the first physical port that joins the channel. Consequently, the trust state of the first physical port need not match the trust state of the channel.

Conversely, when you change the trust state on the port channel, the switch configures a new trust state on all the physical ports that comprise the channel.

- The rate limit is calculated separately on each switch in a switch stack. For a cross-stack EtherChannel, this means that the actual rate limit might be higher than the configured value. For example, if you set the rate limit to 30 pps on an EtherChannel that has one port on switch 1 and one port on switch 2, each port can receive packets at 29 pps without causing the EtherChannel to become error-disabled.
- The operating rate for the port channel is cumulative across all the physical ports within the channel. For example, if you configure the port channel with an ARP rate-limit of 400 pps, all the interfaces combined on the channel receive an aggregate 400 pps. The rate of incoming ARP packets on EtherChannel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on the channel-port members.

The rate of incoming packets on a physical port is checked against the port-channel configuration rather than the physical-ports configuration. The rate-limit configuration on a port channel is independent of the configuration on its physical ports.

If the EtherChannel receives more ARP packets than the configured rate, the channel (including all physical ports) is placed in the error-disabled state.

- Make sure to limit the rate of ARP packets on incoming trunk ports. Configure trunk ports with higher rates to reflect their aggregation and to handle packets across multiple dynamic ARP inspection-enabled VLANs. You also can use the **ip arp inspection limit none** interface configuration command to make the rate unlimited. A high rate-limit on one VLAN can cause a denial-of-service attack to other VLANs when the software places the port in the error-disabled state.
- When you enable dynamic ARP inspection on the switch, policers that were configured to police ARP traffic are no longer effective. The result is that all ARP traffic is sent to the CPU.

## Understanding Dynamic ARP Inspection

ARP provides IP communication within a Layer 2 broadcast domain by mapping an IP address to a MAC address. For example, Host B wants to send information to Host A but does not have the MAC address of Host A in its ARP cache. Host B generates a broadcast message for all hosts within the broadcast domain to obtain the MAC address associated with the IP address of Host A. All hosts within the broadcast domain receive the ARP request, and Host A responds with its MAC address. However, because ARP allows a gratuitous reply from a host even if an ARP request was not received, an ARP spoofing attack and the poisoning of ARP caches can occur. After the attack, all traffic from the device under attack flows through the attacker's computer and then to the router, switch, or host.

A malicious user can attack hosts, switches, and routers connected to your Layer 2 network by poisoning the ARP caches of systems connected to the subnet and by intercepting traffic intended for other hosts on the subnet. Figure 26-1 shows an example of ARP cache poisoning.

**Figure 105: ARP Cache Poisoning**

Hosts A, B, and C are connected to the switch on interfaces A, B and C, all of which are on the same subnet. Their IP and MAC addresses are shown in parentheses; for example, Host A uses IP address IA and MAC address MA. When Host A needs to communicate to Host B at the IP layer, it broadcasts an ARP request for the MAC address associated with IP address IB. When the switch and Host B receive the ARP request, they populate their ARP caches with an ARP binding for a host with the IP address IA and a MAC address MA; for example, IP address IA is bound to MAC address MA. When Host B responds, the switch and Host A populate their ARP caches with a binding for a host with the IP address IB and the MAC address MB.

Host C can poison the ARP caches of the switch, Host A, and Host B by broadcasting forged ARP responses with bindings for a host with an IP address of IA (or IB) and a MAC address of MC. Hosts with poisoned ARP caches use the MAC address MC as the destination MAC address for traffic intended for IA or IB. This means that Host C intercepts that traffic. Because Host C knows the true MAC addresses associated with IA and IB, it can forward the intercepted traffic to those hosts by using the correct MAC address as the destination. Host C has inserted itself into the traffic stream from Host A to Host B, the classic *man-in-the-middle* attack.

Dynamic ARP inspection is a security feature that validates ARP packets in a network. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks.

Dynamic ARP inspection ensures that only valid ARP requests and responses are relayed. The switch performs these activities:

- Intercepts all ARP requests and responses on untrusted ports
- Verifies that each of these intercepted packets has a valid IP-to-MAC address binding before updating the local ARP cache or before forwarding the packet to the appropriate destination
- Drops invalid ARP packets

Dynamic ARP inspection determines the validity of an ARP packet based on valid IP-to-MAC address bindings stored in a trusted database, the DHCP snooping binding database. This database is built by DHCP snooping if DHCP snooping is enabled on the VLANs and on the switch. If the ARP packet is received on a trusted interface, the switch forwards the packet without any checks. On untrusted interfaces, the switch forwards the packet only if it is valid.

You enable dynamic ARP inspection on a per-VLAN basis by using the **ip arp inspection vlan** *vlan-range* global configuration command.

In non-DHCP environments, dynamic ARP inspection can validate ARP packets against user-configured ARP access control lists (ACLs) for hosts with statically configured IP addresses. You define an ARP ACL by using the **arp access-list** *acl-name* global configuration command.

You can configure dynamic ARP inspection to drop ARP packets when the IP addresses in the packets are invalid or when the MAC addresses in the body of the ARP packets do not match the addresses specified in the Ethernet header. Use the **ip arp inspection validate** **{[src-mac] [dst-mac] [ip]}** global configuration command.

## Interface Trust States and Network Security

Dynamic ARP inspection associates a trust state with each interface on the switch. Packets arriving on trusted interfaces bypass all dynamic ARP inspection validation checks, and those arriving on untrusted interfaces undergo the dynamic ARP inspection validation process.

In a typical network configuration, you configure all switch ports connected to host ports as untrusted and configure all switch ports connected to switches as trusted. With this configuration, all ARP packets entering the network from a given switch bypass the security check. No other validation is needed at any other place in the VLAN or in the network. You configure the trust setting by using the **ip arp inspection trust interface** configuration command.

---

**Caution**

Use the trust state configuration carefully. Configuring interfaces as untrusted when they should be trusted can result in a loss of connectivity.

---

In the following figure, assume that both Switch A and Switch B are running dynamic ARP inspection on the VLAN that includes Host 1 and Host 2. If Host 1 and Host 2 acquire their IP addresses from the DHCP server connected to Switch A, only Switch A binds the IP-to-MAC address of Host 1. Therefore, if the interface between Switch A and Switch B is untrusted, the ARP packets from Host 1 are dropped by Switch B. Connectivity between Host 1 and Host 2 is lost.

Figure 106: ARP Packet Validation on a VLAN Enabled for Dynamic ARP Inspection

Configuring interfaces to be trusted when they are actually untrusted leaves a security hole in the network. If Switch A is not running dynamic ARP inspection, Host 1 can easily poison the ARP cache of Switch B (and Host 2, if the link between the switches is configured as trusted). This condition can occur even though Switch B is running dynamic ARP inspection.

Dynamic ARP inspection ensures that hosts (on untrusted interfaces) connected to a switch running dynamic ARP inspection do not poison the ARP caches of other hosts in the network. However, dynamic ARP inspection does not prevent hosts in other portions of the network from poisoning the caches of the hosts that are connected to a switch running dynamic ARP inspection.

In cases in which some switches in a VLAN run dynamic ARP inspection and other switches do not, configure the interfaces connecting such switches as untrusted. However, to validate the bindings of packets from nondynamic ARP inspection switches, configure the switch running dynamic ARP inspection with ARP ACLs. When you cannot determine such bindings, at Layer 3, isolate switches running dynamic ARP inspection from switches not running dynamic ARP inspection switches.

**Note** Depending on the setup of the DHCP server and the network, it might not be possible to validate a given ARP packet on all switches in the VLAN.

## Rate Limiting of ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack. By default, the rate for untrusted interfaces is 15 packets per second (pps). Trusted interfaces are not rate-limited. You can change this setting by using the **ip arp inspection limit** interface configuration command.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you intervene. You can use the **errdisable recovery** global configuration command to enable error disable recovery so that ports automatically emerge from this state after a specified timeout period.

**Note** The rate limit for an EtherChannel is applied separately to each switch in a stack. For example, if a limit of 20 pps is configured on the EtherChannel, each switch with ports in the EtherChannel can carry up to 20 pps. If any switch exceeds the limit, the entire EtherChannel is placed into the error-disabled state.

## Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the **ip arp inspection filter vlan** global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

## Logging of Dropped Packets

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

You use the **ip arp inspection log-buffer** global configuration command to configure the number of entries in the buffer and the number of entries needed in the specified interval to generate system messages. You specify the type of packets that are logged by using the **ip arp inspection vlan logging** global configuration command.

## Default Dynamic ARP Inspection Configuration

Feature	Default Settings
Dynamic ARP inspection	Disabled on all VLANs.
Interface trust state	All interfaces are untrusted.
Rate limit of incoming ARP packets	The rate is 15 pps on untrusted interfaces, assuming that the network is a switched network with a host connecting to as many as 15 new hosts per second.  The rate is unlimited on all trusted interfaces.  The burst interval is 1 second.
ARP ACLs for non-DHCP environments	No ARP ACLs are defined.
Validation checks	No checks are performed.

Feature	Default Settings
Log buffer	<p>When dynamic ARP inspection is enabled, all denied or dropped ARP packets are logged.</p> <p>The number of entries in the log is 32.</p> <p>The number of system messages is limited to 5 per second.</p> <p>The logging-rate interval is 1 second.</p>
Per-VLAN logging	All denied or dropped ARP packets are logged.

## Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the `ip arp inspection filter vlan` global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

## Configuring ARP ACLs for Non-DHCP Environments

This procedure shows how to configure dynamic ARP inspection when Switch B shown in Figure 2 does not support dynamic ARP inspection or DHCP snooping.

If you configure port 1 on Switch A as trusted, a security hole is created because both Switch A and Host 1 could be attacked by either Switch B or Host 2. To prevent this possibility, you must configure port 1 on Switch A as untrusted. To permit ARP packets from Host 2, you must set up an ARP ACL and apply it to VLAN 1. If the IP address of Host 2 is not static (it is impossible to apply the ACL configuration on Switch A) you must separate Switch A from Switch B at Layer 3 and use a router to route packets between them.

Follow these steps to configure an ARP ACL on Switch A. This procedure is required in non-DHCP environments.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **arp access-list** *acl-name*
4. **permit ip host** *sender-ip* **mac host** *sender-mac*
5. **exit**
6. **ip arp inspection filter** *arp-acl-name* **vlan** *vlan-range* [**static**]
7. **interface** *interface-id*
8. **no ip arp inspection trust**
9. **end**
10. Use the following show commands:

- `show arp access-list acl-name`
- `show ip arp inspection vlan vlan-range`
- `show ip arp inspection interfaces`

11. `show running-config`
12. `copy running-config startup-config`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><code>enable</code></p> <p><b>Example:</b></p> <pre>Device&gt; enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<p><code>configure terminal</code></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters the global configuration mode.
<b>Step 3</b>	<p><code>arp access-list acl-name</code></p>	<p>Defines an ARP ACL, and enters ARP access-list configuration mode. By default, no ARP access lists are defined.</p> <p><b>Note</b> At the end of the ARP access list, there is an implicit <code>deny ip any mac any</code> command.</p>
<b>Step 4</b>	<p><code>permit ip host sender-ip mac host sender-mac</code></p>	<p>Permits ARP packets from the specified host (Host 2).</p> <ul style="list-style-type: none"> <li>• For <i>sender-ip</i>, enter the IP address of Host 2.</li> <li>• For <i>sender-mac</i>, enter the MAC address of Host 2.</li> </ul>
<b>Step 5</b>	<p><code>exit</code></p>	Returns to global configuration mode.
<b>Step 6</b>	<p><code>ip arp inspection filter arp-acl-name vlan vlan-range [static]</code></p>	<p>Applies ARP ACL to the VLAN. By default, no defined ARP ACLs are applied to any VLAN.</p> <ul style="list-style-type: none"> <li>• For <i>arp-acl-name</i>, specify the name of the ACL created in Step 2.</li> <li>• For <i>vlan-range</i>, specify the VLAN that the switches and hosts are in. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</li> <li>• (Optional) Specify <b>static</b> to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.</li> </ul>

	Command or Action	Purpose
		<p>If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL.</p> <p>ARP packets containing only IP-to-MAC address bindings are compared against the ACL. Packets are permitted only if the access list permits them.</p>
<b>Step 7</b>	<b>interface</b> <i>interface-id</i>	Specifies Switch A interface that is connected to Switch B, and enters the interface configuration mode.
<b>Step 8</b>	<b>no ip arp inspection trust</b>	<p>Configures Switch A interface that is connected to Switch B as untrusted.</p> <p>By default, all interfaces are untrusted.</p> <p>For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the <b>ip arp inspection vlan logging</b> global configuration command.</p>
<b>Step 9</b>	<b>end</b>	Returns to privileged EXEC mode.
<b>Step 10</b>	<p>Use the following show commands:</p> <ul style="list-style-type: none"> <li>• <b>show arp access-list</b> <i>acl-name</i></li> <li>• <b>show ip arp inspection vlan</b> <i>vlan-range</i></li> <li>• <b>show ip arp inspection interfaces</b></li> </ul>	Verifies your entries.
<b>Step 11</b>	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>	Verifies your entries.
<b>Step 12</b>	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

# Configuring Dynamic ARP Inspection in DHCP Environments

## Before you begin

This procedure shows how to configure dynamic ARP inspection when two switches support this feature. Host 1 is connected to Switch A, and Host 2 is connected to Switch B. Both switches are running dynamic ARP inspection on VLAN 1 where the hosts are located. A DHCP server is connected to Switch A. Both hosts acquire their IP addresses from the same DHCP server. Therefore, Switch A has the bindings for Host 1 and Host 2, and Switch B has the binding for Host 2.

**Note** Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

Follow these steps to configure dynamic ARP inspection. You must perform this procedure on both switches. This procedure is required.

## SUMMARY STEPS

1. **enable**
2. **show cdp neighbors**
3. **configure terminal**
4. **ip arp inspection vlan *vlan-range***
5. **Interface *interface-id***
6. **ip arp inspection trust**
7. **end**
8. **show ip arp inspection interfaces**
9. **show ip arp inspection vlan *vlan-range***
10. **show ip dhcp snooping binding**
11. **show ip arp inspection statistics vlan *vlan-range***
12. **configure terminal**
13. **configure terminal**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>show cdp neighbors</b> <b>Example:</b> Device(config-if) # <b>show cdp neighbors</b>	Verify the connection between the switches.

	Command or Action	Purpose
Step 3	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
Step 4	<b>ip arp inspection vlan <i>vlan-range</i></b> <b>Example:</b> Device(config)# <code>ip arp inspection vlan 1</code>	Enable dynamic ARP inspection on a per-VLAN basis. By default, dynamic ARP inspection is disabled on all VLANs. For <i>vlan-range</i> , specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094. Specify the same VLAN ID for both switches.
Step 5	<b>Interface</b> <i>interface-id</i> <b>Example:</b> Device(config)# <code>interface gigabitethernet1/0/1</code>	Specifies the interface connected to the other switch, and enter interface configuration mode.
Step 6	<b>ip arp inspection trust</b> <b>Example:</b> Device(config-if)# <code>ip arp inspection trust</code>	<p>Configures the connection between the switches as trusted. By default, all interfaces are untrusted.</p> <p>The switch does not check ARP packets that it receives from the other switch on the trusted interface. It simply forwards the packets.</p> <p>For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the <code>ip arp inspection vlan logging global</code> configuration command.</p>
Step 7	<b>end</b> <b>Example:</b> Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.
Step 8	<b>show ip arp inspection interfaces</b> <b>Example:</b>	Verifies the dynamic ARP inspection configuration on interfaces.
Step 9	<b>show ip arp inspection vlan <i>vlan-range</i></b> <b>Example:</b> Device(config-if)# <code>show ip arp inspection vlan 1</code>	Verifies the dynamic ARP inspection configuration on VLAN.
Step 10	<b>show ip dhcp snooping binding</b> <b>Example:</b>	Verifies the DHCP bindings.

	Command or Action	Purpose
	Device(config-if)# <code>show ip dhcp snooping binding</code>	
<b>Step 11</b>	<b>show ip arp inspection statistics vlan <i>vlan-range</i></b> <b>Example:</b> Device(config-if)# <code>show ip arp inspection statistics vlan 1</code>	Checks the dynamic ARP inspection statistics on VLAN.
<b>Step 12</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 13</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.

## Limiting the Rate of Incoming ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you enable error-disabled recovery so that ports automatically emerge from this state after a specified timeout period.

### Note

Unless you configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the **no ip arp inspection limit** interface configuration command, the interface reverts to its default rate limit.

Follow these steps to limit the rate of incoming ARP packets. This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **ip arp inspection limit {rate pps [burst interval seconds] | none}**
5. **exit**
6. Use the following commands:
  - **errdisable detect cause arp-inspection**

- **errdisable recovery cause arp-inspection**
  - **errdisable recovery interval** *interval*
7. **exit**
  8. Use the following show commands:
    - **show ip arp inspection interfaces**
    - **show errdisable recovery**
  9. **show running-config**
  10. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 3	<b>interface</b> <i>interface-id</i>	Specifies the interface to be rate-limited, and enter interface configuration mode.
Step 4	<b>ip arp inspection limit {rate pps [burst interval seconds]   none}</b>	Limits the rate of incoming ARP requests and responses on the interface. The default rate is 15 pps on untrusted interfaces and unlimited on trusted interfaces. The burst interval is 1 second.  The keywords have these meanings: <ul style="list-style-type: none"> <li>• For <b>ratepps</b>, specify an upper limit for the number of incoming packets processed per second. The range is 0 to 2048 pps.</li> <li>• (Optional) For <b>burst intervalseconds</b>, specify the consecutive interval in seconds, over which the interface is monitored for a high rate of ARP packets. The range is 1 to 15.</li> <li>• For <b>rate none</b>, specify no upper limit for the rate of incoming ARP packets that can be processed.</li> </ul>
Step 5	<b>exit</b>	Returns to global configuration mode.

	Command or Action	Purpose
<b>Step 6</b>	Use the following commands: <ul style="list-style-type: none"> <li>• <b>errdisable detect cause arp-inspection</b></li> <li>• <b>errdisable recovery cause arp-inspection</b></li> <li>• <b>errdisable recovery interval <i>interval</i></b></li> </ul>	(Optional) Enables error recovery from the dynamic ARP inspection error-disabled state, and configure the dynamic ARP inspection recover mechanism variables.  By default, recovery is disabled, and the recovery interval is 300 seconds.  For <b>interval <i>interval</i></b> , specify the time in seconds to recover from the error-disabled state. The range is 30 to 86400.
<b>Step 7</b>	<b>exit</b>	Returns to privileged EXEC mode.
<b>Step 8</b>	Use the following show commands: <ul style="list-style-type: none"> <li>• <b>show ip arp inspection interfaces</b></li> <li>• <b>show errdisable recovery</b></li> </ul>	Verifies your settings.
<b>Step 9</b>	<b>show running-config</b>  <b>Example:</b>  Device# <b>show running-config</b>	Verifies your entries.
<b>Step 10</b>	<b>copy running-config startup-config</b>  <b>Example:</b>  Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Performing Dynamic ARP Inspection Validation Checks

Dynamic ARP inspection intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. You can configure the switch to perform additional checks on the destination MAC address, the sender and target IP addresses, and the source MAC address.

Follow these steps to perform specific checks on incoming ARP packets. This procedure is optional.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip arp inspection validate {[src-mac] [dst-mac] [ip]}**
4. **exit**
5. **show ip arp inspection vlan *vlan-range***
6. **show running-config**
7. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 3	<b>ip arp inspection validate {[src-mac] [dst-mac] [ip]}</b>	<p>Performs a specific check on incoming ARP packets. By default, no checks are performed.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• For <b>src-mac</b>, check the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</li> <li>• For <b>dst-mac</b>, check the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</li> <li>• For <b>ip</b>, check the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses. Sender IP addresses are checked in all ARP requests and responses, and target IP addresses are checked only in ARP responses.</li> </ul> <p>You must specify at least one of the keywords. Each command overrides the configuration of the previous command; that is, if a command enables src and dst mac validations, and a second command enables IP validation only, the src and dst mac validations are disabled as a result of the second command.</p>
Step 4	<b>exit</b>	Returns to privileged EXEC mode.
Step 5	<b>show ip arp inspection vlan <i>vlan-range</i></b>	Verifies your settings.
Step 6	<b>show running-config</b> <b>Example:</b>	Verifies your entries.

	Command or Action	Purpose
	Device# <code>show running-config</code>	
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Monitoring DAI

To monitor DAI, use the following commands:

Command	Description
<code>clear ip arp inspection statistics</code>	Clears dynamic ARP inspection statistics.
<code>show ip arp inspection statistics [vlan <i>vlan-range</i>]</code>	Displays statistics for forwarded, dropped, MAC validation failure, IP validation failure, ACL permitted and denied, and DHCP permitted and denied packets for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).
<code>clear ip arp inspection log</code>	Clears the dynamic ARP inspection log buffer.
<code>show ip arp inspection log</code>	Displays the configuration and contents of the dynamic ARP inspection log buffer.

For the `show ip arp inspection statistics` command, the switch increments the number of forwarded packets for each ARP request and response packet on a trusted dynamic ARP inspection port. The switch increments the number of ACL or DHCP permitted packets for each packet that is denied by source MAC, destination MAC, or IP validation checks, and the switch increments the appropriate.

## Verifying the DAI Configuration

To display and verify the DAI configuration, use the following commands:

Command	Description
<code>show arp access-list [acl-name]</code>	Displays detailed information about ARP ACLs.
<code>show ip arp inspection interfaces [interface-id]</code>	Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.

Command	Description
<b>show ip arp inspection vlan</b> <i>vlan-range</i>	Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).

## CHAPTER 88

# Configuring IEEE 802.1x Port-Based Authentication

---

This chapter describes how to configure IEEE 802.1x port-based authentication. IEEE 802.1x authentication prevents unauthorized devices (clients) from gaining access to the network. Unless otherwise noted, the term *switch* refers to a standalone switch or a switch stack.

- [Additional References, on page 1816](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About 802.1x Port-Based Authentication

The 802.1x standard defines a client-server-based access control and authentication protocol that prevents unauthorized clients from connecting to a LAN through publicly accessible ports unless they are properly authenticated. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

---

**Note** TACACS is not supported with 802.1x authentication.

---

Until the client is authenticated, 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

---

**Note** To view debug logs for RADIUS and AAA, use the **show platform software trace message smd** command. For more information, see the Trace Commands section in *Command Reference Guide, Cisco IOS XE Denali 16.1.1*

---

## Port-Based Authentication Process

To configure IEEE 802.1X port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

The AAA process begins with authentication. When 802.1x port-based authentication is enabled and the client supports 802.1x-compliant client software, these events occur:

- If the client identity is valid and the 802.1x authentication succeeds, the switch grants the client access to the network.
- If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can use the client MAC address for authorization. If the client MAC address is valid and the authorization succeeds, the switch grants the client access to the network. If the client MAC address is invalid and the authorization fails, the switch assigns the client to a guest VLAN that provides limited services if a guest VLAN is configured.
- If the switch gets an invalid identity from an 802.1x-capable client and a restricted VLAN is specified, the switch can assign the client to a restricted VLAN that provides limited services.
- If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network by putting the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN.

---

**Note** Inaccessible authentication bypass is also referred to as critical authentication or the AAA fail policy.

---

If Multi Domain Authentication (MDA) is enabled on a port, this flow can be used with some exceptions that are applicable to voice authorization.

Figure 107: Authentication Flowchart

This figure shows the authentication process.

The switch re-authenticates a client when one of these situations occurs:

- Periodic re-authentication is enabled, and the re-authentication timer expires.

You can configure the re-authentication timer to use a switch-specific value or to be based on values from the RADIUS server.

After 802.1x authentication using a RADIUS server is configured, the switch uses timers based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]).

The Session-Timeout RADIUS attribute (Attribute[27]) specifies the time after which re-authentication occurs.

The Termination-Action RADIUS attribute (Attribute [29]) specifies the action to take during re-authentication. The actions are *Initialize* and *ReAuthenticate*. When the *Initialize* action is set (the attribute value is *DEFAULT*), the 802.1x session ends, and connectivity is lost during re-authentication. When the *ReAuthenticate* action is set (the attribute value is *RADIUS-Request*), the session is not affected during re-authentication.

- You manually re-authenticate the client by entering the **dot1x re-authenticate interface interface-id** privileged EXEC command.

## Port-Based Authentication Initiation and Message Exchange

During 802.1x authentication, the switch or the client can initiate authentication. If you enable authentication on a port by using the **authentication port-control auto** interface configuration command, the switch initiates authentication when the link state changes from down to up or periodically as long as the port remains up and unauthenticated. The switch sends an EAP-request/identity frame to the client to request its identity. Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client's identity.

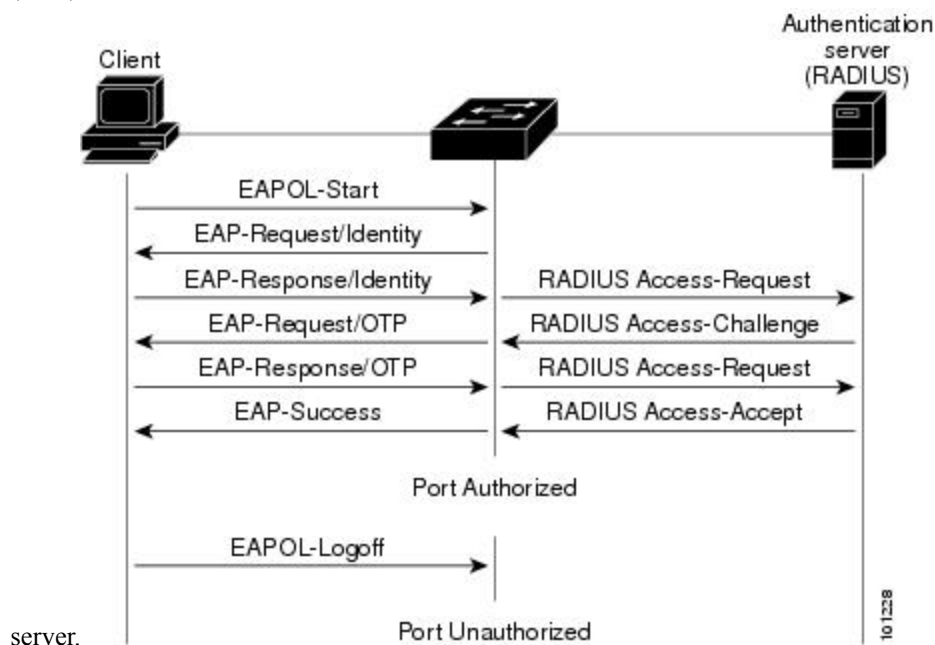

**Note** If 802.1x authentication is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client sends frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized. If the authentication fails, authentication can be retried, the port might be assigned to a VLAN that provides limited services, or network access is not granted.

The specific exchange of EAP frames depends on the authentication method being used.

**Figure 108: Message Exchange**

This figure shows a message exchange initiated by the client when the client uses the One-Time-Password (OTP) authentication method with a RADIUS

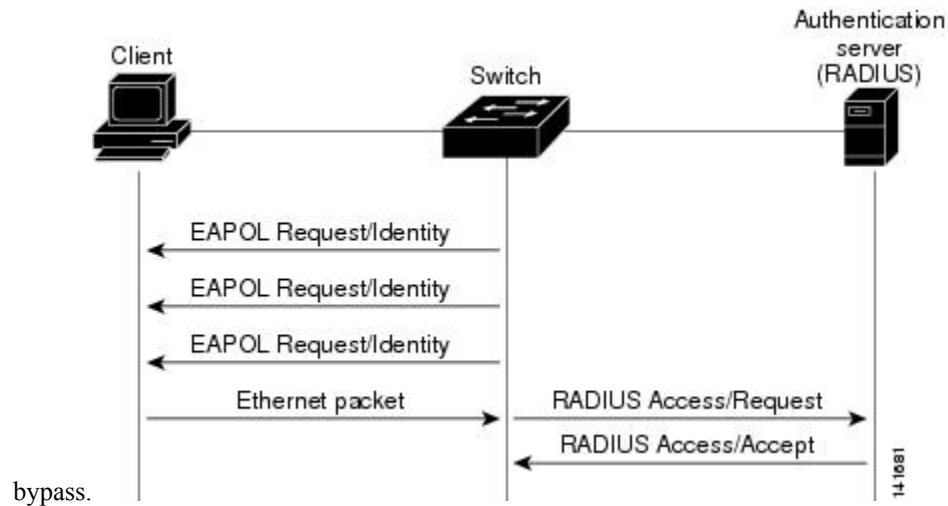

If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can authorize the client when the switch detects an Ethernet packet from the

client. The switch uses the MAC address of the client as its identity and includes this information in the RADIUS-access/request frame that is sent to the RADIUS server. After the server sends the switch the RADIUS-access/accept frame (authorization is successful), the port becomes authorized. If authorization fails and a guest VLAN is specified, the switch assigns the port to the guest VLAN. If the switch detects an EAPOL packet while waiting for an Ethernet packet, the switch stops the MAC authentication bypass process and starts 802.1x authentication.

**Figure 109: Message Exchange During MAC Authentication Bypass**

This figure shows the message exchange during MAC authentication

## Authentication Manager for Port-Based Authentication

### Port-Based Authentication Methods

**Table 141: 802.1x Features**

Authentication method	Mode			
	Single host	Multiple host	MDA	Multiple Authentication
802.1x	VLAN assignment Per-user ACL Filter-ID attribute Downloadable ACL Redirect URL	VLAN assignment	VLAN assignment Per-user ACL Filter-ID attribute Downloadable ACL Redirect URL	VLAN assignment Per-user ACL Filter-ID attribute Downloadable ACL Redirect URL

Authentication method	Mode			
	Single host	Multiple host	MDA	Multiple Authentication
MAC authentication bypass	VLAN assignment Per-user ACL Filter-ID attribute Downloadable ACL Redirect URL	VLAN assignment	VLAN assignment Per-user ACL Filter-Id attribute Downloadable ACL Redirect URL	VLAN assignment Per-user ACL Filter-Id attribute Downloadable ACL Redirect URL
Standalone web authentication	Proxy ACL, Filter-Id attribute, downloadable ACL			
NAC Layer 2 IP validation	Filter-Id attribute Downloadable ACL Redirect URL	Filter-Id attribute Downloadable ACL Redirect URL	Filter-Id attribute Downloadable ACL Redirect URL	Filter-Id attribute Downloadable ACL Redirect URL
Web authentication as fallback method	Proxy ACL Filter-Id attribute Downloadable ACL	Proxy ACL Filter-Id attribute Downloadable ACL	Proxy ACL Filter-Id attribute Downloadable ACL	Proxy ACL Filter-Id attribute Downloadable ACL

<sup>16</sup> Supported in Cisco IOS Release 12.2(50)SE and later.

<sup>17</sup> For clients that do not support 802.1x authentication.

## Per-User ACLs and Filter-Ids

**Note** Using role-based ACLs as Filter-Id is not recommended.

More than one host can be authenticated on MDA-enabled and multiauth ports. The ACL policy applied for one host does not effect the traffic of another host. If only one host is authenticated on a multi-host port, and the other hosts gain network access without authentication, the ACL policy for the first host can be applied to the other connected hosts by specifying any in the source address.

## Port-Based Authentication Manager CLI Commands

The authentication-manager interface-configuration commands control all the authentication methods, such as 802.1x, MAC authentication bypass, and web authentication. The authentication manager commands determine the priority and order of authentication methods applied to a connected host.

The authentication manager commands control generic authentication features, such as host-mode, violation mode, and the authentication timer. Generic authentication commands include the **authentication host-mode**, **authentication violation**, and **authentication timer** interface configuration commands.

802.1x-specific commands begin with the **dot1x** keyword. For example, the **authentication port-control auto** interface configuration command enables authentication on an interface.

To disable dot1x on a switch, remove the configuration globally by using the **no dot1x system-auth-control** command, and also remove it from all configured interfaces.

**Note** If 802.1x authentication is globally disabled, other authentication methods are still enabled on that port, such as web authentication.

To re-enable dot1x on the switch, you must configure both the dot1x global and interface configurations. Incomplete configurations can cause high CPU utilization.

The **authentication manager** commands provide the same functionality as earlier 802.1x commands.

When filtering out verbose system messages generated by the authentication manager, the filtered content typically relates to authentication success. You can also filter verbose messages for 802.1x authentication and MAB authentication. There is a separate command for each authentication method:

- The **no authentication logging verbose** global configuration command filters verbose messages from the authentication manager.
- The **no dot1x logging verbose** global configuration command filters 802.1x authentication verbose messages.
- The **no mab logging verbose** global configuration command filters MAC authentication bypass (MAB) verbose messages

**Table 142: Authentication Manager Commands and Earlier 802.1x Commands**

The authentication manager commands in Cisco IOS Release 12.2(50)SE or later	The equivalent 802.1x commands in Cisco IOS Release 12.2(46)SE and earlier	Description
<b>authentication control-direction</b> {both   in}	<b>dot1x control-direction</b> {both   in}	Enable 802.1x authentication with the wake-on-LAN (WoL) feature, and configure the port control as unidirectional or bidirectional.
<b>authentication event</b>	<b>dot1x auth-fail vlan</b> <b>dot1x critical (interface configuration)</b> <b>dot1x guest-vlan6</b>	Enable the restricted VLAN on a port. Enable the inaccessible-authentication-bypass feature. Specify an active VLAN as an 802.1x guest VLAN.
<b>authentication fallback</b> <i>fallback-profile</i>	<b>dot1x fallback</b> <i>fallback-profile</i>	Configure a port to use web authentication as a fallback method for clients that do not support 802.1x authentication.
<b>authentication host-mode</b> [multi-auth   multi-domain   multi-host   single-host]	<b>dot1x host-mode</b> {single-host   multi-host   multi-domain}	Allow a single host (client) or multiple hosts on an 802.1x-authorized port.

The authentication manager commands in Cisco IOS Release 12.2(50)SE or later	The equivalent 802.1x commands in Cisco IOS Release 12.2(46)SE and earlier	Description
<code>authentication order</code>	<code>mab</code>	Provides the flexibility to define the order of authentication methods to be used.
<code>authentication periodic</code>	<code>dot1x reauthentication</code>	Enable periodic re-authentication of the client.
<code>authentication port-control {auto   force-authorized   force-unauthorized}</code>	<code>dot1x port-control {auto   force-authorized   force-unauthorized}</code>	Enable manual control of the authorization state of the port.
<code>authentication timer</code>	<code>dot1x timeout</code>	Set the 802.1x timers.
<code>authentication violation {protect   restrict   shutdown}</code>	<code>dot1x violation-mode {shutdown   restrict   protect}</code>	Configure the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port.

## Ports in Authorized and Unauthorized States

During 802.1x authentication, depending on the switch port state, the switch can grant a client access to the network. The port starts in the *unauthorized* state. While in this state, the port that is not configured as a voice VLAN port disallows all ingress and egress traffic except for 802.1x authentication, CDP, and STP packets. When a client is successfully authenticated, the port changes to the *authorized* state, allowing all traffic for the client to flow normally. If the port is configured as a voice VLAN port, the port allows VoIP traffic and 802.1x protocol packets before the client is successfully authenticated.

**Note** CDP bypass is not supported and may cause a port to go into err-disabled state.

If a client that does not support 802.1x authentication connects to an unauthorized 802.1x port, the switch requests the client's identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an 802.1x-enabled client connects to a port that is not running the 802.1x standard, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

You control the port authorization state by using the **authentication port-control** interface configuration command and these keywords:

- **force-authorized**—disables 802.1x authentication and causes the port to change to the authorized state without any authentication exchange required. The port sends and receives normal traffic without 802.1x-based authentication of the client. This is the default setting.

- **force-unauthorized**—causes the port to remain in the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.
- **auto**—enables 802.1x authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port changes from down to up or when an EAPOL-start frame is received. The switch requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the switch by using the client MAC address.

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can resend the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to change to the unauthorized state.

If the link state of a port changes from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

## Port-Based Authentication and Switch Stacks

If a switch is added to or removed from a switch stack, 802.1x authentication is not affected as long as the IP connectivity between the RADIUS server and the stack remains intact. This statement also applies if the stack master is removed from the switch stack. Note that if the stack master fails, a stack member becomes the new stack master by using the election process, and the 802.1x authentication process continues as usual.

If IP connectivity to the RADIUS server is interrupted because the switch that was connected to the server is removed or fails, these events occur:

- Ports that are already authenticated and that do not have periodic re-authentication enabled remain in the authenticated state. Communication with the RADIUS server is not required.
- Ports that are already authenticated and that have periodic re-authentication enabled (with the **dot1x re-authentication** global configuration command) fail the authentication process when the re-authentication occurs. Ports return to the unauthenticated state during the re-authentication process. Communication with the RADIUS server is required.

For an ongoing authentication, the authentication fails immediately because there is no server connectivity.

If the switch that failed comes up and rejoins the switch stack, the authentications might or might not fail depending on the boot-up time and whether the connectivity to the RADIUS server is re-established by the time the authentication is attempted.

To avoid loss of connectivity to the RADIUS server, you should ensure that there is a redundant connection to it. For example, you can have a redundant connection to the stack master and another to a stack member, and if the stack master fails, the switch stack still has connectivity to the RADIUS server.

## 802.1x Host Mode

You can configure an 802.1x port for single-host or for multiple-hosts mode. In single-host mode, only one client can be connected to the 802.1x-enabled switch port. The switch detects the client by sending an EAPOL

frame when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

In multiple-hosts mode, you can attach multiple hosts to a single 802.1x-enabled port. In this mode, only one of the attached clients must be authorized for all clients to be granted network access. If the port becomes unauthorized (re-authentication fails or an EAPOL-logoff message is received), the switch denies network access to all of the attached clients. In this topology, the wireless access point is responsible for authenticating the clients attached to it, and it also acts as a client to the switch.

**Figure 110: Multiple Host Mode Example**

**Note** For all host modes, the line protocol stays up before authorization when port-based authentication is configured.

The switch supports multidomain authentication (MDA), which allows both a data device and a voice device, such as an IP Phone (Cisco or non-Cisco), to connect to the same switch port.

## 802.1x Multiple Authentication Mode

Multiple-authentication (multiauth) mode allows multiple authenticated clients on the data VLAN and voice VLAN. Each host is individually authenticated. There is no limit to the number of data or voice device that can be authenticated on a multiauthport.

If a hub or access point is connected to an 802.1x-enabled port, each connected client must be authenticated. For non-802.1x devices, you can use MAC authentication bypass or web authentication as the per-host authentication fallback method to authenticate different hosts with different methods on a single port.

**Note** When a port is in multiple-authentication mode, the authentication-failed VLAN features do not activate.

You can assign a RADIUS-server-supplied VLAN in multi-auth mode, under the following conditions:

- The host is the first host authorized on the port, and the RADIUS server supplies VLAN information
- Subsequent hosts are authorized with a VLAN that matches the operational VLAN.
- A host is authorized on the port with no VLAN assignment, and subsequent hosts either have no VLAN assignment, or their VLAN information matches the operational VLAN.
- The first host authorized on the port has a group VLAN assignment, and subsequent hosts either have no VLAN assignment, or their group VLAN matches the group VLAN on the port. Subsequent hosts must use the same VLAN from the VLAN group as the first host. If a VLAN list is used, all hosts are subject to the conditions specified in the VLAN list.

- After a VLAN is assigned to a host on the port, subsequent hosts must have matching VLAN information or be denied access to the port.
- You cannot configure a guest VLAN or an auth-fail VLAN in multi-auth mode.
- The behavior of the critical-auth VLAN is not changed for multi-auth mode. When a host tries to authenticate and the server is not reachable, all authorized hosts are reinitialized in the configured VLAN.

## Multi-auth Per User VLAN assignment

The Multi-auth Per User VLAN assignment feature allows you to create multiple operational access VLANs based on VLANs assigned to the clients on the port that has a single configured access VLAN. The port configured as an access port where the traffic for all the VLANs associated with data domain is not dot1q tagged, and these VLANs are treated as native VLANs.

The number of hosts per multi-auth port is 8, however there can be more hosts.

The following scenarios are associated with the multi-auth Per User VLAN assignments:

### Scenario one

When a hub is connected to an access port, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. This behaviour is similar on a single-host or multi-domain-auth port.

When a second host (H2) is connected and gets assigned to VLAN (V2), the port will have two operational VLANs (V1 and V2). If H1 and H2 sends untagged ingress traffic, H1 traffic is mapped to VLAN (V1) and H2 traffic to VLAN (V2), all egress traffic going out of the port on VLAN (V1) and VLAN (V2) are untagged.

If both the hosts, H1 and H2 are logged out or the sessions are removed due to some reason then VLAN (V1) and VLAN (V2) are removed from the port, and the configured VLAN (V0) is restored on the port.

### Scenario two

When a hub is connected to an access port, and the port is configured with an access VLAN (V0). The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1.

When a second host (H2) is connected and gets authorized without explicit vlan policy, H2 is expected to use the configured VLAN (V0) that is restored on the port. All egress traffic going out of two operational VLANs, VLAN (V0) and VLAN (V1) are untagged.

If host (H2) is logged out or the session is removed due to some reason then the configured VLAN (V0) is removed from the port, and VLAN (V1) becomes the only operational VLAN on the port.

### Scenario three

When a hub is connected to an access port in open mode, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. When a second host (H2) is connected and remains unauthorized, it still has access to operational VLAN (V1) due to open mode.

If host H1 is logged out or the session is removed due to some reason, VLAN (V1) is removed from the port and host (H2) gets assigned to VLAN (V0).

---

**Note** The combination of Open mode and VLAN assignment has an adverse affect on host (H2) because it has an IP address in the subnet that corresponds to VLAN (V1).

---

### Limitation in Multi-auth Per User VLAN assignment

In the Multi-auth Per User VLAN assignment feature, egress traffic from multiple vlans are untagged on a port where the hosts receive traffic that is not meant for them. This can be a problem with broadcast and multicast traffic.

- **IPv4 ARPs:** Hosts receive ARP packets from other subnets. This is a problem if two subnets in different Virtual Routing and Forwarding (VRF) tables with overlapping IP address range are active on the port. The host ARP cache may get invalid entries.

- **IPv6 control packets:** In IPv6 deployments, Router Advertisements (RA) are processed by hosts that are not supposed to receive them. When a host from one VLAN receives RA from a different VLAN, the host assign incorrect IPv6 address to itself. Such a host is unable to get access to the network.

The workaround is to enable the IPv6 first hop security so that the broadcast ICMPv6 packets are converted to unicast and sent out from multi-auth enabled ports.. The packet is replicated for each client in multi-auth port belonging to the VLAN and the destination MAC is set to an individual client. Ports having one VLAN, ICMPv6 packets broadcast normally.

- **IP multicast:** Multicast traffic destined to a multicast group gets replicated for different VLANs if the hosts on those VLANs join the multicast group. When two hosts in different VLANs join a multicast group (on the same mutli-auth port), two copies of each multicast packet are sent out from that port.

## MAC Move

When a MAC address is authenticated on one switch port, that address is not allowed on another authentication manager-enabled port of the switch. If the switch detects that same MAC address on another authentication manager-enabled port, the address is not allowed.

There are situations where a MAC address might need to move from one port to another on the same switch. For example, when there is another device (for example a hub or an IP phone) between an authenticated host and a switch port, you might want to disconnect the host from the device and connect it directly to another port on the same switch.

You can globally enable MAC move so the device is reauthenticated on the new port. When a host moves to a second port, the session on the first port is deleted, and the host is reauthenticated on the new port. MAC move is supported on all host modes. (The authenticated host can move to any port on the switch, no matter which host mode is enabled on the that port.) When a MAC address moves from one port to another, the switch terminates the authenticated session on the original port and initiates a new authentication sequence on the new port. The MAC move feature applies to both voice and data hosts.

---

**Note** In open authentication mode, a MAC address is immediately moved from the original port to the new port, with no requirement for authorization on the new port.

---

## MAC Replace

The MAC replace feature can be configured to address the violation that occurs when a host attempts to connect to a port where another host was previously authenticated.

**Note** This feature does not apply to ports in multi-auth mode, because violations are not triggered in that mode. It does not apply to ports in multiple host mode, because in that mode, only the first host requires authentication.

If you configure the **authentication violation** interface configuration command with the **replace** keyword, the authentication process on a port in multi-domain mode is:

- A new MAC address is received on a port with an existing authenticated MAC address.
- The authentication manager replaces the MAC address of the current data host on the port with the new MAC address.
- The authentication manager initiates the authentication process for the new MAC address.
- If the authentication manager determines that the new host is a voice host, the original voice host is removed.

If a port is in open authentication mode, any new MAC address is immediately added to the MAC address table.

## 802.1x Accounting

The 802.1x standard defines how users are authorized and authenticated for network access but does not keep track of network usage. 802.1x accounting is disabled by default. You can enable 802.1x accounting to monitor this activity on 802.1x-enabled ports:

- User successfully authenticates.
- User logs off.
- Link-down occurs.
- Re-authentication successfully occurs.
- Re-authentication fails.

The switch does not log 802.1x accounting information. Instead, it sends this information to the RADIUS server, which must be configured to log accounting messages.

## 802.1x Accounting Attribute-Value Pairs

The information sent to the RADIUS server is represented in the form of Attribute-Value (AV) pairs. These AV pairs provide data for different applications. (For example, a billing application might require information that is in the Acct-Input-Octets or the Acct-Output-Octets attributes of a RADIUS packet.)

AV pairs are automatically sent by a switch that is configured for 802.1x accounting. Three types of RADIUS accounting packets are sent by a switch:

- START—sent when a new user session starts

- INTERIM—sent during an existing session for updates
- STOP—sent when a session terminates

**Note** To view debug logs for RADIUS and AAA, use the **show platform software trace message smd** command. For more information, see the Tracing Commands section in *Command Reference Guide, Cisco IOS XE Denali 16.1.1*.

This table lists the AV pairs and when they are sent are sent by the switch.

**Table 143: Accounting AV Pairs**

Attribute Number	AV Pair Name	START	INTERIM	STOP
Attribute[1]	User-Name	Always	Always	Always
Attribute[4]	NAS-IP-Address	Always	Always	Always
Attribute[5]	NAS-Port	Always	Always	Always

Attribute[49]	Acct-Terminate-Cause	Never	Never	Always
Attribute[61]	NAS-Port-Type	Always	Always	Always

<sup>18</sup> The Framed-IP-Address AV pair is sent when a valid static IP address is configured or w when a Dynamic Host Control Protocol (DHCP) binding exists for the host in the DHCP snooping bindings table.

## 802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable. You use an alternate authentication such as MAC authentication bypass or web authentication for the devices that do not support 802.1x functionality.

This feature only works if the supplicant on the client supports a query with the NOTIFY EAP notification packet. The client must respond within the 802.1x timeout value.

## Switch-to-RADIUS-Server Communication

RADIUS security servers are identified by their hostname or IP address, hostname and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authentication—the second host entry configured acts as the fail-over backup to the first one. The RADIUS host entries are tried in the order that they were configured.

## 802.1x Authentication with VLAN Assignment

The switch supports 802.1x authentication with VLAN assignment. After successful 802.1x authentication of a port, the RADIUS server sends the VLAN assignment to configure the switch port. The RADIUS server database maintains the username-to-VLAN mappings, assigning the VLAN based on the username of the client connected to the switch port. You can use this feature to limit network access for certain users.

Voice device authentication is supported with multidomain host mode in Cisco IOS Release 12.2(37)SE. In Cisco IOS Release 12.2(40)SE and later, when a voice device is authorized and the RADIUS server returned an authorized VLAN, the voice VLAN on the port is configured to send and receive packets on the assigned voice VLAN. Voice VLAN assignment behaves the same as data VLAN assignment on multidomain authentication (MDA)-enabled ports.

When configured on the switch and the RADIUS server, 802.1x authentication with VLAN assignment has these characteristics:

- If no VLAN is supplied by the RADIUS server or if 802.1x authentication is disabled, the port is configured in its access VLAN after successful authentication. Recall that an access VLAN is a VLAN assigned to an access port. All packets sent from or received on this port belong to this VLAN.
- If 802.1x authentication is enabled but the VLAN information from the RADIUS server is not valid, authorization fails and configured VLAN remains in use. This prevents ports from appearing unexpectedly in an inappropriate VLAN because of a configuration error.

Configuration errors could include specifying a VLAN for a routed port, a malformed VLAN ID, a nonexistent or internal (routed port) VLAN ID, an RSPAN VLAN, a shut down or suspended VLAN. In the case of a multidomain host port, configuration errors can also be due to an attempted assignment of a data VLAN that matches the configured or assigned voice VLAN ID (or the reverse).

- If 802.1x authentication is enabled and all information from the RADIUS server is valid, the authorized device is placed in the specified VLAN after authentication.
- If the multiple-hosts mode is enabled on an 802.1x port, all hosts are placed in the same VLAN (specified by the RADIUS server) as the first authenticated host.
- Enabling port security does not impact the RADIUS server-assigned VLAN behavior.
- If 802.1x authentication is disabled on the port, it is returned to the configured access VLAN and configured voice VLAN.
- If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:
  - If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, then authorization of all devices on the port is terminated and multidomain host mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.
  - If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to *dot1p* or *untagged* results in voice device un-authorization and the disablement of multi-domain host mode.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.

If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:

- If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, authorization of all devices on the port is terminated and multidomain host mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.
- If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to *dot1p* or *untagged* results in voice device un-authorization and the disablement of multi-domain host mode.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.

To configure VLAN assignment you need to perform these tasks:

- Enable AAA authorization by using the **network** keyword to allow interface configuration from the RADIUS server.
- Enable 802.1x authentication. (The VLAN assignment feature is automatically enabled when you configure 802.1x authentication on an access port).
- Assign vendor-specific tunnel attributes in the RADIUS server. The RADIUS server must return these attributes to the switch:
  - [64] Tunnel-Type = VLAN
  - [65] Tunnel-Medium-Type = 802

- [81] Tunnel-Private-Group-ID = VLAN name or VLAN ID
- [83] Tunnel-Preference

Attribute [64] must contain the value *VLAN* (type 13). Attribute [65] must contain the value *802* (type 6). Attribute [81] specifies the *VLAN name* or *VLAN ID* assigned to the IEEE 802.1x-authenticated user.

## 802.1x Authentication with Per-User ACLs

You can enable per-user access control lists (ACLs) to provide different levels of network access and service to an 802.1x-authenticated user. When the RADIUS server authenticates a user connected to an 802.1x port, it retrieves the ACL attributes based on the user identity and sends them to the switch. The switch applies the attributes to the 802.1x port for the duration of the user session. The switch removes the per-user ACL configuration when the session is over, if authentication fails, or if a link-down condition occurs. The switch does not save RADIUS-specified ACLs in the running configuration. When the port is unauthorized, the switch removes the ACL from the port.

You can configure router ACLs and input port ACLs on the same switch. However, a port ACL takes precedence over a router ACL. If you apply input port ACL to an interface that belongs to a VLAN, the port ACL takes precedence over an input router ACL applied to the VLAN interface. Incoming packets received on the port to which a port ACL is applied are filtered by the port ACL. Incoming routed packets received on other ports are filtered by the router ACL. Outgoing routed packets are filtered by the router ACL. To avoid configuration conflicts, you should carefully plan the user profiles stored on the RADIUS server.

RADIUS supports per-user attributes, including vendor-specific attributes. These vendor-specific attributes (VSAs) are in octet-string format and are passed to the switch during the authentication process. The VSAs used for per-user ACLs are `inACL#<n>` for the ingress direction and `outACL#<n>` for the egress direction. MAC ACLs are supported only in the ingress direction. The switch supports VSAs only in the ingress direction. It does not support port ACLs in the egress direction on Layer 2 ports.

Use only the extended ACL syntax style to define the per-user configuration stored on the RADIUS server. When the definitions are passed from the RADIUS server, they are created by using the extended naming convention. However, if you use the Filter-Id attribute, it can point to a standard ACL.

You can use the Filter-Id attribute to specify an inbound or outbound ACL that is already configured on the switch. The attribute contains the ACL number followed by `.in` for ingress filtering or `.out` for egress filtering. If the RADIUS server does not allow the `.in` or `.out` syntax, the access list is applied to the outbound ACL by default. Because of limited support of Cisco IOS access lists on the switch, the Filter-Id attribute is supported only for IP ACLs numbered 1 to 199 and 1300 to 2699 (IP standard and IP extended ACLs).

The maximum size of the per-user ACL is 4000 ASCII characters but is limited by the maximum size of RADIUS-server per-user ACLs.

To configure per-user ACLs:

- Enable AAA authentication.
- Enable AAA authorization by using the **network** keyword to allow interface configuration from the RADIUS server.
- Enable 802.1x authentication.
- Configure the user profile and VSAs on the RADIUS server.
- Configure the 802.1x port for single-host mode.

---

**Note** Per-user ACLs are supported only in single-host mode.

---

## 802.1x Authentication with Downloadable ACLs and Redirect URLs

You can download ACLs and redirect URLs from a RADIUS server to the switch during 802.1x authentication or MAC authentication bypass of the host. You can also download ACLs during web authentication.

---

**Note** A downloadable ACL is also referred to as a *dACL*.

---

If more than one host is authenticated and the host is in single-host, MDA, or multiple-authentication mode, the switch changes the source address of the ACL to the host IP address.

You can apply the ACLs and redirect URLs to all the devices connected to the 802.1x-enabled port.

If no ACLs are downloaded during 802.1x authentication, the switch applies the static default ACL on the port to the host. On a voice VLAN port configured in multi-auth or MDA mode, the switch applies the ACL only to the phone as part of the authorization policies.

---

**Note** The limit for dACL with stacking is 64 ACEs per dACL per port. The limit without stacking is the number of available TCAM entries which varies based on the other ACL features that are active.

---

## Cisco Secure ACS and Attribute-Value Pairs for the Redirect URL

The switch uses these *cisco-av-pair* VSAs:

- url-redirect is the HTTP or HTTPS URL.
- url-redirect-acl is the switch ACL name or number.

The switch uses the CiscoSecure-defined-ACL attribute value pair to intercept an HTTP or HTTPS request from the end point. The switch then forwards the client web browser to the specified redirect address. The url-redirect AV pair on the Cisco Secure ACS contains the URL to which the web browser is redirected. The url-redirect-acl attribute value pair contains the name or number of an ACL that specifies the HTTP or HTTPS traffic to redirect.

- 
- Note**
- Traffic that matches a permit ACE in the ACL is redirected.
  - An ACE that matches permit rule of the url-redirect-acl gets the client redirected to url-redirect page. The client traffic is allowed when a deny rule is matched.
  - Define the URL redirect ACL and the default port ACL on the switch.
- 

If a redirect URL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

When security ACL/dACL and punt/redirect ACLs are applied together to the session, the url-redirect-acl has the higher priority.

For more information about using redirect ACLs, refer the document [here](#).

## Cisco Secure ACS and Attribute-Value Pairs for Downloadable ACLs

You can set the CiscoSecure-Defined-ACL Attribute-Value (AV) pair on the Cisco Secure ACS with the RADIUS cisco-av-pair vendor-specific attributes (VSAs). This pair specifies the names of the downloadable ACLs on the Cisco Secure ACS with the #ACL#-IP-name-number attribute.

- The *name* is the ACL name.
- The *number* is the version number (for example, 3f783768).

If a downloadable ACL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

If the default ACL is configured on the switch and the Cisco Secure ACS sends a host-access-policy to the switch, it applies the policy to traffic from the host connected to a switch port. If the policy does not apply, the switch applies the default ACL. If the Cisco Secure ACS sends the switch a downloadable ACL, this ACL takes precedence over the default ACL that is configured on the switch port. However, if the switch receives an host access policy from the Cisco Secure ACS but the default ACL is not configured, the authorization failure is declared.

## VLAN ID-based MAC Authentication

You can use VLAN ID-based MAC authentication if you wish to authenticate hosts based on a static VLAN ID instead of a downloadable VLAN. When you have a static VLAN policy configured on your switch, VLAN information is sent to an IAS (Microsoft) RADIUS server along with the MAC address of each host for authentication. The VLAN ID configured on the connected port is used for MAC authentication. By using VLAN ID-based MAC authentication with an IAS server, you can have a fixed number of VLANs in the network.

The feature also limits the number of VLANs monitored and handled by STP. The network can be managed as a fixed VLAN.

---

**Note** This feature is not supported on Cisco ACS Server. (The ACS server ignores the sent VLAN-IDs for new hosts and only authenticates based on the MAC address.)

---

## 802.1x Authentication with Guest VLAN

You can configure a guest VLAN for each 802.1x port on the switch to provide limited services to clients, such as downloading the 802.1x client. These clients might be upgrading their system for 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.

When you enable a guest VLAN on an 802.1x port, the switch assigns clients to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.

The switch maintains the EAPOL packet history. If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an IEEE 802.1x-capable supplicant, and the interface does not change to the guest VLAN state. EAPOL history is cleared if the interface link status goes down. If no EAPOL packet is detected on the interface, the interface changes to the guest VLAN state.

If the switch is trying to authorize an 802.1x-capable voice device and the AAA server is unavailable, the authorization attempt fails, but the detection of the EAPOL packet is saved in the EAPOL history. When the AAA server becomes available, the switch authorizes the voice device. However, the switch no longer allows other devices access to the guest VLAN. To prevent this situation, use one of these command sequences:

- Enter the **authentication event no-response action authorize vlan** *vlan-id* interface configuration command to allow access to the guest VLAN.
- Enter the **shutdown** interface configuration command followed by the **no shutdown** interface configuration command to restart the port.

If devices send EAPOL packets to the switch during the lifetime of the link, the switch no longer allows clients that fail authentication access to the guest VLAN.

---

**Note** If an EAPOL packet is detected after the interface has changed to the guest VLAN, the interface reverts to an unauthorized state, and 802.1x authentication restarts.

---

Any number of 802.1x-incapable clients are allowed access when the switch port is moved to the guest VLAN. If an 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on 802.1x ports in single host, multiple host, multi-auth and multi-domain modes.

You can configure any active VLAN except an RSPAN VLAN, a private VLAN, or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

The switch supports *MAC authentication bypass*. When MAC authentication bypass is enabled on an 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified.

## 802.1x Authentication with Restricted VLAN

You can configure a restricted VLAN (also referred to as an *authentication failed VLAN*) for each IEEE 802.1x port on a switch stack or a switch to provide limited services to clients that cannot access the guest VLAN. These clients are 802.1x-compliant and cannot access another VLAN because they fail the authentication process. A restricted VLAN allows users without valid credentials in an authentication server (typically, visitors to an enterprise) to access a limited set of services. The administrator can control the services available to the restricted VLAN.

**Note** You can configure a VLAN to be both the guest VLAN and the restricted VLAN if you want to provide the same services to both types of users.

Without this feature, the client attempts and fails authentication indefinitely, and the switch port remains in the spanning-tree blocking state. With this feature, you can configure the switch port to be in the restricted VLAN after a specified number of authentication attempts (the default value is 3 attempts).

The authenticator counts the failed authentication attempts for the client. When this count exceeds the configured maximum number of authentication attempts, the port moves to the restricted VLAN. The failed attempt count increments when the RADIUS server replies with either an *EAP failure* or an empty response without an EAP packet. When the port moves into the restricted VLAN, the failed attempt counter resets.

Users who fail authentication remain in the restricted VLAN until the next re-authentication attempt. A port in the restricted VLAN tries to re-authenticate at configured intervals (the default is 60 seconds). If re-authentication fails, the port remains in the restricted VLAN. If re-authentication is successful, the port moves either to the configured VLAN or to a VLAN sent by the RADIUS server. You can disable re-authentication. If you do this, the only way to restart the authentication process is for the port to receive a *link down* or *EAP logoff* event. We recommend that you keep re-authentication enabled if a client might connect through a hub. When a client disconnects from the hub, the port might not receive the *link down* or *EAP logoff* event.

After a port moves to the restricted VLAN, a simulated EAP success message is sent to the client. This prevents clients from indefinitely attempting authentication. Some clients (for example, devices running Windows XP) cannot implement DHCP without EAP success.

Restricted VLANs are supported on 802.1x ports in all host modes and on Layer 2 ports.

You can configure any active VLAN except an RSPAN VLAN, a primary private VLAN, or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

Other security port features such as dynamic ARP Inspection, DHCP snooping, and IP source guard can be configured independently on a restricted VLAN.

## 802.1x Authentication with Inaccessible Authentication Bypass

Use the inaccessible authentication bypass feature, also referred to as *critical authentication* or the *AAA fail policy*, when the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated. You can configure the switch to connect those hosts to *critical ports*.

When a new host tries to connect to the critical port, that host is moved to a user-specified access VLAN, the *critical VLAN*. The administrator gives limited authentication to the hosts.

When the switch tries to authenticate a host connected to a critical port, the switch checks the status of the configured RADIUS server. If a server is available, the switch can authenticate the host. However, if all the RADIUS servers are unavailable, the switch grants network access to the host and puts the port in the *critical-authentication* state, which is a special case of the authentication state.

### Inaccessible Authentication Bypass Support on Multiple-Authentication Ports

When a port is configured on any host mode and the AAA server is unavailable, the port is then configured to multi-host mode and moved to the critical VLAN. To support this inaccessible bypass on

multiple-authentication (multiauth) ports, use the **authentication event server dead action reinitialize vlan *vlan-id*** command. When a new host tries to connect to the critical port, that port is reinitialized and all the connected hosts are moved to the user-specified access VLAN.

This command is supported on all host modes.

## Inaccessible Authentication Bypass Authentication Results

The behavior of the inaccessible authentication bypass feature depends on the authorization state of the port:

- If the port is unauthorized when a host connected to a critical port tries to authenticate and all servers are unavailable, the switch puts the port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.
- If the port is already authorized and reauthentication occurs, the switch puts the critical port in the critical-authentication state in the current VLAN, which might be the one previously assigned by the RADIUS server.
- If the RADIUS server becomes unavailable during an authentication exchange, the current exchange times out, and the switch puts the critical port in the critical-authentication state during the next authentication attempt.

You can configure the critical port to reinitialize hosts and move them out of the critical VLAN when the RADIUS server is again available. When this is configured, all critical ports in the critical-authentication state are automatically re-authenticated.

## Inaccessible Authentication Bypass Feature Interactions

Inaccessible authentication bypass interacts with these features:

- Guest VLAN—Inaccessible authentication bypass is compatible with guest VLAN. When a guest VLAN is enabled on 8021.x port, the features interact as follows:
  - If at least one RADIUS server is available, the switch assigns a client to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.
  - If all the RADIUS servers are not available and the client is connected to a critical port, the switch authenticates the client and puts the critical port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.
  - If all the RADIUS servers are not available and the client is not connected to a critical port, the switch might not assign clients to the guest VLAN if one is configured.
  - If all the RADIUS servers are not available and if a client is connected to a critical port and was previously assigned to a guest VLAN, the switch keeps the port in the guest VLAN.
- Restricted VLAN—If the port is already authorized in a restricted VLAN and the RADIUS servers are unavailable, the switch puts the critical port in the critical-authentication state in the restricted VLAN.
- 802.1x accounting—Accounting is not affected if the RADIUS servers are unavailable.
- Private VLAN—You can configure inaccessible authentication bypass on a private VLAN host port. The access VLAN must be a secondary private VLAN.

- Voice VLAN—Inaccessible authentication bypass is compatible with voice VLAN, but the RADIUS-configured or user-specified access VLAN and the voice VLAN must be different.
- Remote Switched Port Analyzer (RSPAN)—Do not configure an RSPAN VLAN as the RADIUS-configured or user-specified access VLAN for inaccessible authentication bypass.

In a switch stack:

- The stack master checks the status of the RADIUS servers by sending keepalive packets. When the status of a RADIUS server changes, the stack master sends the information to the stack members. The stack members can then check the status of RADIUS servers when re-authenticating critical ports.
- If the new stack master is elected, the link between the switch stack and RADIUS server might change, and the new stack immediately sends keepalive packets to update the status of the RADIUS servers. If the server status changes from *dead* to *alive*, the switch re-authenticates all switch ports in the critical-authentication state.

When a member is added to the stack, the stack master sends the member the server status.

---

**Note** Switch stacks are supported only on Catalyst 2960-S switches running the LAN base image.

---

## 802.1x Critical Voice VLAN

When an IP phone connected to a port is authenticated by the access control server (ACS), the phone is put into the voice domain. If the ACS is not reachable, the switch cannot determine if the device is a voice device. If the server is unavailable, the phone cannot access the voice network and therefore cannot operate.

For data traffic, you can configure inaccessible authentication bypass, or critical authentication, to allow traffic to pass through on the native VLAN when the server is not available. If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network and puts the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN. When the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated, the switch connects those hosts to critical ports. A new host trying to connect to the critical port is moved to a user-specified access VLAN, the critical VLAN, and granted limited authentication.

You can enter the **authentication event server dead action authorize voice** interface configuration command to configure the critical voice VLAN feature. When the ACS does not respond, the port goes into critical authentication mode. When traffic coming from the host is tagged with the voice VLAN, the connected device (the phone) is put in the configured voice VLAN for the port. The IP phones learn the voice VLAN identification through CDP (Cisco devices) or through LLDP or DHCP.

You can configure the voice VLAN for a port by entering the **switchport voice vlan *vlan-id*** interface configuration command.

This feature is supported in multidomain and multi-auth host modes. Although you can enter the command when the switch in single-host or multi-host mode, the command has no effect unless the device changes to multidomain or multi-auth host mode.

## 802.1x User Distribution

You can configure 802.1x user distribution to load-balance users with the same group name across multiple different VLANs.

The VLANs are either supplied by the RADIUS server or configured through the switch CLI under a VLAN group name.

- Configure the RADIUS server to send more than one VLAN name for a user. The multiple VLAN names can be sent as part of the response to the user. The 802.1x user distribution tracks all the users in a particular VLAN and achieves load balancing by moving the authorized user to the least populated VLAN.
- Configure the RADIUS server to send a VLAN group name for a user. The VLAN group name can be sent as part of the response to the user. You can search for the selected VLAN group name among the VLAN group names that you configured by using the switch CLI. If the VLAN group name is found, the corresponding VLANs under this VLAN group name are searched to find the least populated VLAN. Load balancing is achieved by moving the corresponding authorized user to that VLAN.

---

**Note** The RADIUS server can send the VLAN information in any combination of VLAN-IDs, VLAN names, or VLAN groups.

---

### 802.1x User Distribution Configuration Guidelines

- Confirm that at least one VLAN is mapped to the VLAN group.
- You can map more than one VLAN to a VLAN group.
- You can modify the VLAN group by adding or deleting a VLAN.
- When you clear an existing VLAN from the VLAN group name, none of the authenticated ports in the VLAN are cleared, but the mappings are removed from the existing VLAN group.
- If you clear the last VLAN from the VLAN group name, the VLAN group is cleared.
- You can clear a VLAN group even when the active VLANs are mapped to the group. When you clear a VLAN group, none of the ports or users that are in the authenticated state in any VLAN within the group are cleared, but the VLAN mappings to the VLAN group are cleared.

## IEEE 802.1x Authentication with Voice VLAN Ports

A voice VLAN port is a special access port associated with two VLAN identifiers:

- VVID to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.
- PVID to carry the data traffic to and from the workstation connected to the switch through the IP phone. The PVID is the native VLAN of the port.

The IP phone uses the VVID for its voice traffic, regardless of the authorization state of the port. This allows the phone to work independently of IEEE 802.1x authentication.

In single-host mode, only the IP phone is allowed on the voice VLAN. In multiple-hosts mode, additional clients can send traffic on the voice VLAN after a supplicant is authenticated on the PVID. When multiple-hosts mode is enabled, the supplicant authentication affects both the PVID and the VVID.

A voice VLAN port becomes active when there is a link, and the device MAC address appears after the first CDP message from the IP phone. Cisco IP phones do not relay CDP messages from other devices. As a result, if several IP phones are connected in series, the switch recognizes only the one directly connected to it. When IEEE 802.1x authentication is enabled on a voice VLAN port, the switch drops packets from unrecognized IP phones more than one hop away.

When IEEE 802.1x authentication is enabled on a switch port, you can configure an access port VLAN that is also a voice VLAN.

When IP phones are connected to an 802.1x-enabled switch port that is in single host mode, the switch grants the phones network access without authenticating them. We recommend that you use multidomain authentication (MDA) on the port to authenticate both a data device and a voice device, such as an IP phone

---

**Note** If you enable IEEE 802.1x authentication on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the Cisco IP phone loses connectivity to the switch for up to 30 seconds.

---

## IEEE 802.1x Authentication with Port Security

In general, Cisco does not recommend enabling port security when IEEE 802.1x is enabled. Since IEEE 802.1x enforces a single MAC address per port (or per VLAN when MDA is configured for IP telephony), port security is redundant and in some cases may interfere with expected IEEE 802.1x operations.

## IEEE 802.1x Authentication with Wake-on-LAN

The IEEE 802.1x authentication with wake-on-LAN (WoL) feature allows dormant PCs to be powered when the switch receives a specific Ethernet frame, known as the *magic packet*. You can use this feature in environments where administrators need to connect to systems that have been powered down.

When a host that uses WoL is attached through an IEEE 802.1x port and the host powers off, the IEEE 802.1x port becomes unauthorized. The port can only receive and send EAPOL packets, and WoL magic packets cannot reach the host. When the PC is powered off, it is not authorized, and the switch port is not opened.

When the switch uses IEEE 802.1x authentication with WoL, the switch forwards traffic to unauthorized IEEE 802.1x ports, including magic packets. While the port is unauthorized, the switch continues to block ingress traffic other than EAPOL packets. The host can receive packets but cannot send packets to other devices in the network.

---

**Note** If PortFast is not enabled on the port, the port is forced to the bidirectional state.

---

When you configure a port as unidirectional by using the **authentication control-direction in** interface configuration command, the port changes to the spanning-tree forwarding state. The port can send packets to the host but cannot receive packets from the host.

When you configure a port as bidirectional by using the **authentication control-direction both** interface configuration command, the port is access-controlled in both directions. The port does not receive packets from or send packets to the host.

## IEEE 802.1x Authentication with MAC Authentication Bypass

You can configure the switch to authorize clients based on the client MAC address by using the MAC authentication bypass feature. For example, you can enable this feature on IEEE 802.1x ports connected to devices such as printers.

If IEEE 802.1x authentication times out while waiting for an EAPOL response from the client, the switch tries to authorize the client by using MAC authentication bypass.

When the MAC authentication bypass feature is enabled on an IEEE 802.1x port, the switch uses the MAC address as the client identity. The authentication server has a database of client MAC addresses that are allowed network access. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is configured. This process works for most client devices; however, it does not work for clients that use an alternate MAC address format. You can configure how MAB authentication is performed for clients with MAC addresses that deviate from the standard format or where the RADIUS configuration requires the user name and password to differ.

If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an 802.1x-capable supplicant and uses 802.1x authentication (not MAC authentication bypass) to authorize the interface. EAPOL history is cleared if the interface link status goes down.

If the switch already authorized a port by using MAC authentication bypass and detects an IEEE 802.1x supplicant, the switch does not unauthorize the client connected to the port. When re-authentication occurs, the switch uses the authentication or re-authentication methods configured on the port, if the previous session ended because the Termination-Action RADIUS attribute value is `DEFAULT`.

Clients that were authorized with MAC authentication bypass can be re-authenticated. The re-authentication process is the same as that for clients that were authenticated with IEEE 802.1x. During re-authentication, the port remains in the previously assigned VLAN. If re-authentication is successful, the switch keeps the port in the same VLAN. If re-authentication fails, the switch assigns the port to the guest VLAN, if one is configured.

If re-authentication is based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]) and if the Termination-Action RADIUS attribute (Attribute [29]) action is *Initialize* (the attribute value is `DEFAULT`), the MAC authentication bypass session ends, and connectivity is lost during re-authentication. If MAC authentication bypass is enabled and the IEEE 802.1x authentication times out, the switch uses the MAC authentication bypass feature to initiate re-authorization. For more information about these AV pairs, see RFC 3580, “IEEE 802.1X Remote Authentication Dial In User Service (RADIUS) Usage Guidelines.”

MAC authentication bypass interacts with the features:

- IEEE 802.1x authentication—You can enable MAC authentication bypass only if 802.1x authentication is enabled on the port .
- Guest VLAN—If a client has an invalid MAC address identity, the switch assigns the client to a guest VLAN if one is configured.

- Restricted VLAN—This feature is not supported when the client connected to an IEEE 802.1x port is authenticated with MAC authentication bypass.
- Port security
- Voice VLAN
- VLAN Membership Policy Server (VMPS)—IEEE802.1x and VMPS are mutually exclusive.
- Private VLAN—You can assign a client to a private VLAN.

Cisco IOS Release 12.2(55)SE and later supports filtering of verbose MAB system messages

## Network Admission Control Layer 2 IEEE 802.1x Validation

The switch supports the Network Admission Control (NAC) Layer 2 IEEE 802.1x validation, which checks the antivirus condition or *posture* of endpoint systems or clients before granting the devices network access. With NAC Layer 2 IEEE 802.1x validation, you can do these tasks:

- Download the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute[29]) from the authentication server.
- Set the number of seconds between re-authentication attempts as the value of the Session-Timeout RADIUS attribute (Attribute[27]) and get an access policy against the client from the RADIUS server.
- Set the action to be taken when the switch tries to re-authenticate the client by using the Termination-Action RADIUS attribute (Attribute[29]). If the value is the *DEFAULT* or is not set, the session ends. If the value is RADIUS-Request, the re-authentication process starts.
- Set the list of VLAN number or name or VLAN group name as the value of the Tunnel Group Private ID (Attribute[81]) and the preference for the VLAN number or name or VLAN group name as the value of the Tunnel Preference (Attribute[83]). If you do not configure the Tunnel Preference, the first Tunnel Group Private ID (Attribute[81]) attribute is picked up from the list.
- View the NAC posture token, which shows the posture of the client, by using the **show authentication** privileged EXEC command.
- Configure secondary private VLANs as guest VLANs.

Configuring NAC Layer 2 IEEE 802.1x validation is similar to configuring IEEE 802.1x port-based authentication except that you must configure a posture token on the RADIUS server.

## Flexible Authentication Ordering

You can use flexible authentication ordering to configure the order of methods that a port uses to authenticate a new host. The IEEE 802.1X Flexible Authentication feature supports three authentication methods:

- dot1X—IEEE 802.1X authentication is a Layer 2 authentication method.
- mab—MAC-Authentication Bypass is a Layer 2 authentication method.
- webauth—Web authentication is a Layer 3 authentication method.

Using this feature, you can control which ports use which authentication methods, and you can control the failover sequencing of methods on those ports. For example, MAC authentication bypass and 802.1x can be

the primary or secondary authentication methods, and web authentication can be the fallback method if either or both of those authentication attempts fail.

The IEEE 802.1X Flexible Authentication feature supports the following host modes:

- multi-auth—Multiauthentication allows one authentication on a voice VLAN and multiple authentications on the data VLAN.
- multi-domain—Multidomain authentication allows two authentications: one on the voice VLAN and one on the data VLAN.

[Configuring Flexible Authentication Ordering](#), on page 1810

## Open1x Authentication

Open1x authentication allows a device access to a port before that device is authenticated. When open authentication is configured, a new host can pass traffic according to the access control list (ACL) defined on the port. After the host is authenticated, the policies configured on the RADIUS server are applied to that host.

You can configure open authentication with these scenarios:

- Single-host mode with open authentication—Only one user is allowed network access before and after authentication.
- MDA mode with open authentication—Only one user in the voice domain and one user in the data domain are allowed.
- Multiple-hosts mode with open authentication—Any host can access the network.
- Multiple-authentication mode with open authentication—Similar to MDA, except multiple hosts can be authenticated.

---

**Note** If open authentication is configured, it takes precedence over other authentication controls. This means that if you use the **authentication open** interface configuration command, the port will grant access to the host irrespective of the **authentication port-control** interface configuration command.

---

#### Related Topics

[Configuring Open1x](#), on page 1811

## Multidomain Authentication

The switch supports multidomain authentication (MDA), which allows both a data device and voice device, such as an IP phone (Cisco or non-Cisco), to authenticate on the same switch port. The port is divided into a data domain and a voice domain.

---

**Note** For all host modes, the line protocol stays up before authorization when port-based authentication is configured.

---

MDA does not enforce the order of device authentication. However, for best results, we recommend that a voice device is authenticated before a data device on an MDA-enabled port.

Follow these guidelines for configuring MDA:

- You must configure a switch port for MDA.
- You must configure the voice VLAN for the IP phone when the host mode is set to multidomain.
- Voice VLAN assignment on an MDA-enabled port is supported Cisco IOS Release 12.2(40)SE and later.

---

**Note** You can assign a dynamic VLAN to a voice device on an MDA-enabled switch port, but the voice device fails authorization if a static voice VLAN configured on the switchport is the same as the dynamic VLAN assigned for the voice device in the RADIUS server.

---

- To authorize a voice device, the AAA server must be configured to send a Cisco Attribute-Value (AV) pair attribute with a value of *device-traffic-class=voice*. Without this value, the switch treats the voice device as a data device.
- The guest VLAN and restricted VLAN features only apply to the data devices on an MDA-enabled port. The switch treats a voice device that fails authorization as a data device.
- If more than one device attempts authorization on either the voice or the data domain of a port, it is error disabled.
- Until a device is authorized, the port drops its traffic. Non-Cisco IP phones or voice devices are allowed into both the data and voice VLANs. The data VLAN allows the voice device to contact a DHCP server to obtain an IP address and acquire the voice VLAN information. After the voice device starts sending on the voice VLAN, its access to the data VLAN is blocked.
- A voice device MAC address that is binding on the data VLAN is not counted towards the port security MAC address limit.
- You can use dynamic VLAN assignment from a RADIUS server only for data devices.
- MDA can use MAC authentication bypass as a fallback mechanism to allow the switch port to connect to devices that do not support IEEE 802.1x authentication.
- When a *data* or a *voice* device is detected on a port, its MAC address is blocked until authorization succeeds. If the authorization fails, the MAC address remains blocked for 5 minutes.
- If more than five devices are detected on the *data* VLAN or more than one voice device is detected on the *voice* VLAN while a port is unauthorized, the port is error disabled.
- When a port host mode is changed from single- or multihost to multidomain mode, an authorized data device remains authorized on the port. However, a Cisco IP phone that has been allowed on the port voice VLAN is automatically removed and must be reauthenticated on that port.
- Active fallback mechanisms such as guest VLAN and restricted VLAN remain configured after a port changes from single- or multihost mode to multidomain mode.
- Switching a port host mode from multidomain to single- or multihost mode removes all authorized devices from the port.

- If a data domain is authorized first and placed in the guest VLAN, non-IEEE 802.1x-capable voice devices need to tag their packets on the voice VLAN to trigger authentication.
- We do not recommend per-user ACLs with an MDA-enabled port. An authorized device with a per-user ACL policy might impact traffic on both the voice and data VLANs of the port. If used, only one device on the port should enforce per-user ACLs.

## Voice Aware 802.1x Security

**Note** To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature to configure the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. In previous releases, when an attempt to authenticate the data client caused a security violation, the entire port shut down, resulting in a complete loss of connectivity.

You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

[Configuring Voice Aware 802.1x Security](#), on page 1772

## Common Session ID

Authentication manager uses a single session ID (referred to as a common session ID) for a client no matter which authentication method is used. This ID is used for all reporting purposes, such as the show commands and MIBs. The session ID appears with all per-session syslog messages.

The session ID includes:

- The IP address of the Network Access Device (NAD)
- A monotonically increasing unique 32 bit integer
- The session start time stamp (a 32 bit integer)

This example shows how the session ID appears in the output of the show authentication command. The session ID in this example is 160000050000000B288508E5:

```
Device# show authentication sessions
Interface MAC Address Method Domain Status Session ID
Fa4/0/4 0000.0000.0203 mab DATA Authz Success 160000050000000B288508E5
```

This is an example of how the session ID appears in the syslog output. The session ID in this example is also 160000050000000B288508E5:

```
1w0d: %AUTHMGR-5-START: Starting 'mab' for client (0000.0000.0203) on Interface Fa4/0/4
AuditSessionID 160000050000000B288508E5
1w0d: %MAB-5-SUCCESS: Authentication successful for client (0000.0000.0203) on Interface
Fa4/0/4 AuditSessionID 160000050000000B288508E5
```

```
1w0d: %AUTHMGR-7-RESULT: Authentication result 'success' from 'mab' for client
(0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 1600000500000000B288508E5
```

The session ID is used by the NAD, the AAA server, and other report-analyzing applications to identify the client. The ID appears automatically. No configuration is required.

## How to Configure 802.1x Port-Based Authentication

### Default 802.1x Authentication Configuration

*Table 144: Default 802.1x Authentication Configuration*

Feature	Default Setting
Switch 802.1x enable state	Disabled.
Per-port 802.1x enable state	Disabled (force-authorized). The port sends and receives normal traffic without 802.1x-based authentication of the client.
AAA	Disabled.
RADIUS server <ul style="list-style-type: none"> <li>• IP address</li> <li>• UDP authentication port</li> <li>• Default accounting port</li> <li>• Key</li> </ul>	<ul style="list-style-type: none"> <li>• None specified.</li> <li>• 1645.</li> <li>• 1646.</li> <li>• None specified.</li> </ul>
Host mode	Single-host mode.
Control direction	Bidirectional control.
Periodic re-authentication	Disabled.
Number of seconds between re-authentication attempts	3600 seconds.
Re-authentication number	2 times (number of times that the switch restarts the authentication process before the port changes to the unauthorized state).
Quiet period	60 seconds (number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client).
Retransmission time	30 seconds (number of seconds that the switch should wait for a response to an EAP request/identity frame from the client before resending the request).

Feature	Default Setting
Maximum retransmission number	2 times (number of times that the switch will send an EAP-request/identity frame before restarting the authentication process).
Client timeout period	30 seconds (when relaying a request from the authentication server to the client, the amount of time the switch waits for a response before resending the request to the client.)
Authentication server timeout period	30 seconds (when relaying a response from the client to the authentication server, the amount of time the switch waits for a reply before resending the response to the server.)  You can change this timeout period by using the dot1x timeout server-timeout interface configuration command.
Inactivity timeout	Disabled.
Guest VLAN	None specified.
Inaccessible authentication bypass	Disabled.
Restricted VLAN	None specified.
Authenticator (switch) mode	None specified.
MAC authentication bypass	Disabled.
Voice-aware security	Disabled.

## 802.1x Authentication Configuration Guidelines

### 802.1x Authentication

These are the 802.1x authentication configuration guidelines:

- When 802.1x authentication is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.
- If the VLAN to which an 802.1x-enabled port is assigned changes, this change is transparent and does not affect the switch. For example, this change occurs if a port is assigned to a RADIUS server-assigned VLAN and is then assigned to a different VLAN after re-authentication.  
  
If the VLAN to which an 802.1x port is assigned to shut down, disabled, or removed, the port becomes unauthorized. For example, the port is unauthorized after the access VLAN to which a port is assigned shuts down or is removed.
- The 802.1x protocol is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports, but it is not supported on these port types:

- Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1x authentication on a dynamic port, an error message appears, and 802.1x authentication is not enabled. If you try to change the mode of an 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.
- Dynamic-access ports—If you try to enable 802.1x authentication on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and 802.1x authentication is not enabled. If you try to change an 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.
- EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an 802.1x port. If you try to enable 802.1x authentication on an EtherChannel port, an error message appears, and 802.1x authentication is not enabled.
- Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable 802.1x authentication on a SPAN or RSPAN source port.
- Before globally enabling 802.1x authentication on a switch by entering the **dot1x system-auth-control** global configuration command, remove the EtherChannel configuration from the interfaces on which 802.1x authentication and EtherChannel are configured.
- Cisco IOS Release 12.2(55)SE and later supports filtering of system messages related to 802.1x authentication.

## VLAN Assignment, Guest VLAN, Restricted VLAN, and Inaccessible Authentication Bypass

These are the configuration guidelines for VLAN assignment, guest VLAN, restricted VLAN, and inaccessible authentication bypass:

- When 802.1x authentication is enabled on a port, you cannot configure a port VLAN that is equal to a voice VLAN.
- You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.
- After you configure a guest VLAN for an 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the 802.1x authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the 802.1x authentication process (**authentication timer inactivity** and **authentication timer reauthentication** interface configuration commands). The amount to decrease the settings depends on the connected 802.1x client type.
- When configuring the inaccessible authentication bypass feature, follow these guidelines:
  - The feature is supported on 802.1x port in single-host mode and multihosts mode.
  - If the client is running Windows XP and the port to which the client is connected is in the critical-authentication state, Windows XP might report that the interface is not authenticated.
  - If the Windows XP client is configured for DHCP and has an IP address from the DHCP server, receiving an EAP-Success message on a critical port might not re-initiate the DHCP configuration process.

- You can configure the inaccessible authentication bypass feature and the restricted VLAN on an 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, switch changes the port state to the critical authentication state and remains in the restricted VLAN.
- If the CTS links are in Critical Authentication mode and the master reloads, the policy where SGT was configured on a device will not be available on the new master. This is because the internal bindings will not be synced to the standby switch in a 3750-X switch stack.
- You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.
- When wireless guest clients obtains IP from foreign client VLAN instead of anchor client VLAN, you should use the **ip dhcp required** command under the WLAN configuration to force clients to issue a new DHCP request. This prevents the clients from getting an incorrect IP at anchor.
- If the wired guest clients fail to get IP address after a Cisco WLC (foreign) reload, perform a shut/no shut on the ports used by the clients to reconnect them.

## MAC Authentication Bypass

These are the MAC authentication bypass configuration guidelines:

- Unless otherwise stated, the MAC authentication bypass guidelines are the same as the 802.1x authentication guidelines.
- If you disable MAC authentication bypass from a port after the port has been authorized with its MAC address, the port state is not affected.
- If the port is in the unauthorized state and the client MAC address is not the authentication-server database, the port remains in the unauthorized state. However, if the client MAC address is added to the database, the switch can use MAC authentication bypass to re-authorize the port.
- If the port is in the authorized state, the port remains in this state until re-authorization occurs.
- You can configure a timeout period for hosts that are connected by MAC authentication bypass but are inactive. The range is 1 to 65535 seconds.

## Maximum Number of Allowed Devices Per Port

This is the maximum number of devices allowed on an 802.1x-enabled port:

- In single-host mode, only one device is allowed on the access VLAN. If the port is also configured with a voice VLAN, an unlimited number of Cisco IP phones can send and receive traffic through the voice VLAN.
- In multidomain authentication (MDA) mode, one device is allowed for the access VLAN, and one IP phone is allowed for the voice VLAN.
- In multihost mode, only one 802.1x supplicant is allowed on the port, but an unlimited number of non-802.1x hosts are allowed on the access VLAN. An unlimited number of devices are allowed on the voice VLAN.

## Configuring 802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable.

The 802.1x readiness check is allowed on all ports that can be configured for 802.1x. The readiness check is not available on a port that is configured as **dot1x force-unauthorized**.

Follow these steps to enable the 802.1x readiness check on the switch:

### Before you begin

Follow these guidelines to enable the readiness check on the switch:

- The readiness check is typically used before 802.1x is enabled on the switch.
- If you use the **dot1x test eapol-capable** privileged EXEC command without specifying an interface, all the ports on the switch stack are tested.
- When you configure the **dot1x test eapol-capable** command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.
- When you configure the **dot1x test eapol-capable** command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.
- The readiness check can be sent on a port that handles multiple hosts (for example, a PC that is connected to an IP phone). A syslog message is generated for each of the clients that respond to the readiness check within the timer period.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **dot1x test eapol-capable** [**interface** *interface-id*]
4. **dot1x test timeout** *timeout*
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>dot1x test eapol-capable [interface <i>interface-id</i>]</b> <b>Example:</b> Device# <b>dot1x test eapol-capable interface gigabitethernet1/0/13</b> DOT1X_PORT_EAPOL_CAPABLE:DOT1X: MAC 00-01-02-4b-f1-a3 on gigabitethernet1/0/13 is EAPOL capable	Enables the 802.1x readiness check on the switch. (Optional) For <i>interface-id</i> specify the port on which to check for IEEE 802.1x readiness. <b>Note</b> If you omit the optional <b>interface</b> keyword, all interfaces on the switch are tested.
<b>Step 4</b>	<b>dot1x test timeout <i>timeout</i></b>	(Optional) Configures the timeout used to wait for EAPOL response. The range is from 1 to 65535 seconds. The default is 10 seconds.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b> Device# <b>show running-config</b>	Verifies your entries.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring Voice Aware 802.1x Security

**Note** To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature on the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. You can use this feature in IP phone deployments where

a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

Follow these guidelines to configure voice aware 802.1x voice security on the switch:

- You enable voice aware 802.1x security by entering the **errdisable detect cause security-violation shutdown vlan** global configuration command. You disable voice aware 802.1x security by entering the **no** version of this command. This command applies to all 802.1x-configured ports in the switch.

**Note** If you do not include the **shutdown vlan** keywords, the entire port is shut down when it enters the error-disabled state.

- If you use the **errdisable recovery cause security-violation** global configuration command to configure error-disabled recovery, the port is automatically re-enabled. If error-disabled recovery is not configured for the port, you re-enable it by using the **shutdown** and **no shutdown** interface configuration commands.
- You can re-enable individual VLANs by using the **clear errdisable interface interface-id vlan [vlan-list]** privileged EXEC command. If you do not specify a range, all VLANs on the port are enabled.

Beginning in privileged EXEC mode, follow these steps to enable voice aware 802.1x security:

## SUMMARY STEPS

1. **configure terminal**
2. **errdisable detect cause security-violation shutdown vlan**
3. **errdisable recovery cause security-violation**
4. **clear errdisable interface interface-id vlan [vlan-list]**
5. Enter the following:
  - **shutdown**
  - **no shutdown**
6. **end**
7. **show errdisable detect**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>	Enter global configuration mode.
Step 2	<b>errdisable detect cause security-violation shutdown vlan</b>	Shut down any VLAN on which a security violation error occurs.  <b>Note</b> If the <b>shutdown vlan</b> keywords are not included, the entire port enters the error-disabled state and shuts down.
Step 3	<b>errdisable recovery cause security-violation</b>	Enter global configuration mode.

	Command or Action	Purpose
<b>Step 4</b>	<code>clear errdisable interface <i>interface-id</i> vlan [<i>vlan-list</i>]</code>	(Optional) Reenable individual VLANs that have been error disabled. <ul style="list-style-type: none"> <li>• For <i>interface-id</i> specify the port on which to reenable individual VLANs.</li> <li>• (Optional) For <i>vlan-list</i> specify a list of VLANs to be re-enabled. If <i>vlan-list</i> is not specified, all VLANs are re-enabled.</li> </ul>
<b>Step 5</b>	Enter the following: <ul style="list-style-type: none"> <li>• <b>shutdown</b></li> <li>• <b>no shutdown</b></li> </ul>	(Optional) Re-enable an error-disabled VLAN, and clear all error-disable indications.
<b>Step 6</b>	<code>end</code>	Return to privileged EXEC mode.
<b>Step 7</b>	<code>show errdisable detect</code>	Verify your entries.

### Example

This example shows how to configure the switch to shut down any VLAN on which a security violation error occurs:

```
Switch(config)# errdisable detect cause security-violation shutdown vlan
```

This example shows how to re-enable all VLANs that were error disabled on port Gigabit Ethernet 40/2.

```
Switch# clear errdisable interface gigabitethernet4/0/2
vlan
```

You can verify your settings by entering the **show errdisable detect** privileged EXEC command.

[Voice Aware 802.1x Security](#), on page 1766

## Configuring 802.1x Violation Modes

You can configure an 802.1x port so that it shuts down, generates a syslog error, or discards packets from a new device when:

- a device connects to an 802.1x-enabled port
- the maximum number of allowed about devices have been authenticated on the port

Beginning in privileged EXEC mode, follow these steps to configure the security violation actions on the switch:

### SUMMARY STEPS

1. **configure terminal**
2. **aaa new-model**

3. **aaa authentication dot1x {default} method1**
4. **interface interface-id**
5. **switchport mode access**
6. **authentication violation {shutdown | restrict | protect | replace}**
7. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>aaa new-model</b> <b>Example:</b> Device(config)# <b>aaa new-model</b>	Enables AAA.
<b>Step 3</b>	<b>aaa authentication dot1x {default} method1</b> <b>Example:</b> Device(config)# <b>aaa authentication dot1x default group radius</b>	Creates an 802.1x authentication method list.  To create a default list that is used when a named list is <i>not</i> specified in the <b>authentication</b> command, use the <b>default</b> keyword followed by the method that is to be used in default situations. The default method list is automatically applied to all ports.  For <i>method1</i> , enter the <b>group radius</b> keywords to use the list of all RADIUS servers for authentication.
<b>Step 4</b>	<b>interface interface-id</b> <b>Example:</b> Device(config)# <b>interface gigabitethernet1/0/4</b>	Specifies the port connected to the client that is to be enabled for IEEE 802.1x authentication, and enter interface configuration mode.
<b>Step 5</b>	<b>switchport mode access</b> <b>Example:</b> Device(config-if)# <b>switchport mode access</b>	Sets the port to access mode.
<b>Step 6</b>	<b>authentication violation {shutdown   restrict   protect   replace}</b> <b>Example:</b> Device(config-if)# <b>authentication violation restrict</b>	Configures the violation mode. The keywords have these meanings: <ul style="list-style-type: none"> <li>• <b>shutdown</b>—Error disable the port.</li> <li>• <b>restrict</b>—Generate a syslog error.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>protect</b>—Drop packets from any new device that sends traffic to the port.</li> <li>• <b>replace</b>—Removes the current session and authenticates with the new host.</li> </ul>
<b>Step 7</b>	<b>end</b> <b>Example:</b>  Device(config-if) # <b>end</b>	Returns to privileged EXEC mode.

## Configuring 802.1x Authentication

To allow per-user ACLs or VLAN assignment, you must enable AAA authorization to configure the switch for all network-related service requests.

This is the 802.1x AAA process:

### Before you begin

To configure 802.1x port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

### SUMMARY STEPS

1. A user connects to a port on the switch.
2. Authentication is performed.
3. VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.
4. The switch sends a start message to an accounting server.
5. Re-authentication is performed, as necessary.
6. The switch sends an interim accounting update to the accounting server that is based on the result of re-authentication.
7. The user disconnects from the port.
8. The switch sends a stop message to the accounting server.

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	A user connects to a port on the switch.	
<b>Step 2</b>	Authentication is performed.	
<b>Step 3</b>	VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.	
<b>Step 4</b>	The switch sends a start message to an accounting server.	
<b>Step 5</b>	Re-authentication is performed, as necessary.	

	Command or Action	Purpose
Step 6	The switch sends an interim accounting update to the accounting server that is based on the result of re-authentication.	
Step 7	The user disconnects from the port.	
Step 8	The switch sends a stop message to the accounting server.	

## Configuring 802.1x Port-Based Authentication

Beginning in privileged EXEC mode, follow these steps to configure 802.1x port-based authentication:

### SUMMARY STEPS

1. **configure terminal**
2. **aaa new-model**
3. **aaa authentication dot1x {default} *method1***
4. **dot1x system-auth-control**
5. **aaa authorization network {default} group radius**
6. **radius server *server name***
7. **address {ipv4 | ipv6} *ip address***
8. **key *string***
9. **exit**
10. **interface *interface-id***
11. **switchport mode access**
12. **authentication port-control auto**
13. **dot1x pae authenticator**
14. **end**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b>  Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 2	<b>aaa new-model</b>  <b>Example:</b>  Device(config)# <b>aaa new-model</b>	Enables AAA.
Step 3	<b>aaa authentication dot1x {default} <i>method1</i></b>  <b>Example:</b>	Creates an 802.1x authentication method list.

	Command or Action	Purpose
	<pre>Device(config)# aaa authentication dot1x default group radius</pre>	<p>To create a default list that is used when a named list is <i>not</i> specified in the <b>authentication</b> command, use the <b>default</b> keyword followed by the method that is to be used in default situations. The default method list is automatically applied to all ports.</p> <p>For <i>method1</i>, enter the <b>group radius</b> keywords to use the list of all RADIUS servers for authentication.</p> <p><b>Note</b> Though other keywords are visible in the command-line help string, only the <b>group radius</b> keywords are supported.</p>
<b>Step 4</b>	<p><b>dot1x system-auth-control</b></p> <p><b>Example:</b></p> <pre>Device(config)# dot1x system-auth-control</pre>	Enables 802.1x authentication globally on the switch.
<b>Step 5</b>	<p><b>aaa authorization network {default} group radius</b></p> <p><b>Example:</b></p> <pre>Device(config)# aaa authorization network default group radius</pre>	(Optional) Configures the switch to use user-RADIUS authorization for all network-related service requests, such as per-user ACLs or VLAN assignment.
<b>Step 6</b>	<p><b>radius server <i>server name</i></b></p> <p><b>Example:</b></p> <pre>Device(config)# radius server rsim address ipv4 124.2.2.12</pre>	(Optional) Specifies the IP address of the RADIUS server.
<b>Step 7</b>	<p><b>address {ipv4   ipv6} <i>ip address</i></b></p> <p><b>Example:</b></p> <pre>Device(config-radius-server)# address ipv4 10.0.1.12</pre>	Configures the IP address for the RADIUS server.
<b>Step 8</b>	<p><b>key <i>string</i></b></p> <p><b>Example:</b></p> <pre>Device(config-radius-server)# key rad123</pre>	(Optional) Specifies the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.
<b>Step 9</b>	<p><b>exit</b></p> <p><b>Example:</b></p>	Exits the RADIUS server mode and enters the global configuration mode.

	Command or Action	Purpose
	Device(config-radius-server)# <b>exit</b>	
<b>Step 10</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Device(config)# <b>interface</b> gigabitethernet1/0/2	Specifies the port connected to the client that is to be enabled for IEEE 802.1x authentication, and enter interface configuration mode.
<b>Step 11</b>	<b>switchport mode access</b> <b>Example:</b> Device(config-if)# <b>switchport mode access</b>	(Optional) Sets the port to access mode only if you configured the RADIUS server in Step 6 and Step 7.
<b>Step 12</b>	<b>authentication port-control auto</b> <b>Example:</b> Device(config-if)# <b>authentication port-control auto</b>	Enables 802.1x authentication on the port.
<b>Step 13</b>	<b>dot1x pae authenticator</b> <b>Example:</b> Device(config-if)# <b>dot1x pae authenticator</b>	Sets the interface Port Access Entity to act only as an authenticator and ignore messages meant for a supplicant.
<b>Step 14</b>	<b>end</b> <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring the Switch-to-RADIUS-Server Communication

You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using the **radius server** global configuration command. If you want to configure these options on a per-server basis, use the **radius-server timeout**, the **radius-server retransmit**, and the **key string** global configuration commands.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

Follow these steps to configure the RADIUS server parameters on the switch. This procedure is required.

**Before you begin**

You must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **radius server** *server name*
4. **address {ipv4 | ipv6}** *ip address* **auth-port** *port number* **acct-port** *port number*
5. **key** *string*
6. **end**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>radius server</b> <i>server name</i> <b>Example:</b> Device(config)# <b>radius server rsim</b>	Specifies the name the RADIUS server and enters radius server configuration mode.
<b>Step 4</b>	<b>address {ipv4   ipv6}</b> <i>ip address</i> <b>auth-port</b> <i>port number</i> <b>acct-port</b> <i>port number</i> <b>Example:</b> Device(config-radius-server)# <b>address ipv4</b> <b>124.2.2.12</b>	Specifies the IP address of the RADIUS server.  For <b>auth-port</b> <i>port-number</i> , specify the UDP destination port for authentication requests. The default is 1645. The range is 0 to 65536.  For <b>acct-port</b> <i>port-number</i> , specify the UDP destination port for authentication requests. The default is 1646.
<b>Step 5</b>	<b>key</b> <i>string</i> <b>Example:</b> Device(config-radius-server)# <b>key rad123</b>	Specifies the authentication and encryption key used between the Device and the RADIUS daemon running on the RADIUS server.

	Command or Action	Purpose
		<p><b>Note</b> The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the <b>radius server</b> command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</p>
<b>Step 6</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

## Configuring the Host Mode

Beginning in privileged EXEC mode, follow these steps to allow multiple hosts (clients) on an IEEE 802.1x-authorized port that has the **authentication port-control** interface configuration command set to **auto**. Use the **multi-domain** keyword to configure and enable multidomain authentication (MDA), which allows both a host and a voice device, such as an IP phone (Cisco or non-Cisco), on the same switch port. This procedure is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **authentication host-mode** [**multi-auth** | **multi-domain** | **multi-host** | **single-host**]
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Device(config)# interface gigabitethernet2/0/1</pre>	Specifies the port to which multiple hosts are indirectly attached, and enter interface configuration mode.
<b>Step 3</b>	<p><b>authentication host-mode</b> [<b>multi-auth</b>   <b>multi-domain</b>   <b>multi-host</b>   <b>single-host</b>]</p>	Allows multiple hosts (clients) on an 802.1x-authorized port.

	Command or Action	Purpose
	<p><b>Example:</b></p> <pre>Device(config-if)# authentication host-mode multi-host</pre>	<p>The keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• <b>multi-auth</b>—Allow multiple authenticated clients on both the voice VLAN and data VLAN.</li> </ul> <p><b>Note</b> The <b>multi-auth</b> keyword is only available with the <b>authentication host-mode</b> command.</p> <ul style="list-style-type: none"> <li>• <b>multi-host</b>—Allow multiple hosts on an 802.1x-authorized port after a single host has been authenticated.</li> <li>• <b>multi-domain</b>—Allow both a host and a voice device, such as an IP phone (Cisco or non-Cisco), to be authenticated on an IEEE 802.1x-authorized port.</li> </ul> <p><b>Note</b> You must configure the voice VLAN for the IP phone when the host mode is set to <b>multi-domain</b>.</p> <p>Make sure that the <b>authentication port-control</b> interface configuration command is set to <b>auto</b> for the specified interface.</p>
<p><b>Step 4</b></p>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# end</pre>	<p>Returns to privileged EXEC mode.</p>

## Configuring Periodic Re-Authentication

You can enable periodic 802.1x client re-authentication and specify how often it occurs. If you do not specify a time period before enabling re-authentication, the number of seconds between attempts is 3600.

Beginning in privileged EXEC mode, follow these steps to enable periodic re-authentication of the client and to configure the number of seconds between re-authentication attempts. This procedure is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **authentication periodic**
4. **authentication timer** {{{[inactivity | reauthenticate | restart]} {value}}
5. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <b>interface gigabitethernet2/0/1</b>	Specifies the port to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>authentication periodic</b> <b>Example:</b> Device(config-if)# <b>authentication periodic</b>	Enables periodic re-authentication of the client, which is disabled by default.  <b>Note</b> The default value is 3600 seconds. To change the value of the reauthentication timer or to have the switch use a RADIUS-provided session timeout, enter the <b>authentication timer reauthenticate</b> command.
<b>Step 4</b>	<b>authentication timer</b> {[ <b>inactivity</b>   <b>reauthenticate</b>   <b>restart</b> ]} { <i>value</i> } <b>Example:</b> Device(config-if)# <b>authentication timer reauthenticate 180</b>	Sets the number of seconds between re-authentication attempts.  The <b>authentication timer</b> keywords have these meanings: <ul style="list-style-type: none"> <li>• <b>inactivity</b>—Interval in seconds after which if there is no activity from the client then it is unauthorized</li> <li>• <b>reauthenticate</b>—Time in seconds after which an automatic re-authentication attempt is initiated</li> <li>• <b>restart <i>value</i></b>—Interval in seconds after which an attempt is made to authenticate an unauthorized port</li> </ul> This command affects the behavior of the switch only if periodic re-authentication is enabled.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.

## Changing the Quiet Period

When the switch cannot authenticate the client, the switch remains idle for a set period of time and then tries again. The **authentication timer restart** interface configuration command controls the idle period. A failed

authentication of the client might occur because the client provided an invalid password. You can provide a faster response time to the user by entering a number smaller than the default.

Beginning in privileged EXEC mode, follow these steps to change the quiet period. This procedure is optional.

## SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **authentication timer restart** *seconds*
4. **end**
5. **show authentication sessions interface** *interface-id*
6. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Device(config)# <b>interface gigabitethernet2/0/1</b>	Specifies the port to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>authentication timer restart</b> <i>seconds</i> <b>Example:</b> Device(config-if)# <b>authentication timer restart 30</b>	Sets the number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client.  The range is 1 to 65535 seconds; the default is 60.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show authentication sessions interface</b> <i>interface-id</i> <b>Example:</b> Device# <b>show authentication sessions interface gigabitethernet2/0/1</b>	Verifies your entries.

	Command or Action	Purpose
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Changing the Switch-to-Client Retransmission Time

The client responds to the EAP-request/identity frame from the switch with an EAP-response/identity frame. If the switch does not receive this response, it waits a set period of time (known as the retransmission time) and then resends the frame.

**Note** You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to change the amount of time that the switch waits for client notification. This procedure is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **authentication timer reauthenticate** *seconds*
4. **end**
5. **show authentication sessions interface** *interface-id*
6. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Device(config)# <code>interface gigabitethernet2/0/1</code>	Specifies the port to be configured, and enter interface configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>authentication timer reauthenticate</b> <i>seconds</i> <b>Example:</b> Device(config-if)# <b>authentication timer reauthenticate 60</b>	Sets the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request.  The range is 1 to 65535 seconds; the default is 5.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show authentication sessions interface</b> <i>interface-id</i> <b>Example:</b> Device# <b>show authentication sessions interface gigabitethernet2/0/1</b>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Setting the Switch-to-Client Frame-Retransmission Number

In addition to changing the switch-to-client retransmission time, you can change the number of times that the switch sends an EAP-request/identity frame (assuming no response is received) to the client before restarting the authentication process.

### Note

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the switch-to-client frame-retransmission number. This procedure is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **dot1x max-reauth-req** *count*
4. **end**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
Step 2	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <code>interface gigabitethernet2/0/1</code>	Specifies the port to be configured, and enter interface configuration mode.
Step 3	<b>dot1x max-reauth-req <i>count</i></b> <b>Example:</b> Device(config-if)# <code>dot1x max-reauth-req 5</code>	Sets the number of times that the switch sends an EAP-request/identity frame to the client before restarting the authentication process. The range is 1 to 10; the default is 2.
Step 4	<b>end</b> <b>Example:</b> Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.

## Setting the Re-Authentication Number

You can also change the number of times that the switch restarts the authentication process before the port changes to the unauthorized state.

**Note** You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the re-authentication number. This procedure is optional.

## SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `switchport mode access`
4. `dot1x max-req count`
5. `end`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b>  Device# <code>interface gigabitethernet2/0/1</code>	Specifies the port to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>switchport mode access</b> <b>Example:</b>  Device(config-if)# <code>switchport mode access</code>	Sets the port to access mode only if you previously configured the RADIUS server.
<b>Step 4</b>	<b>dot1x max-req <i>count</i></b> <b>Example:</b>  Device(config-if)# <code>dot1x max-req 4</code>	Sets the number of times that the switch restarts the authentication process before the port changes to the unauthorized state. The range is 0 to 10; the default is 2.
<b>Step 5</b>	<b>end</b> <b>Example:</b>  Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.

## Enabling MAC Move

MAC move allows an authenticated host to move from one port on the switch to another.

Beginning in privileged EXEC mode, follow these steps to globally enable MAC move on the switch. This procedure is optional.

## SUMMARY STEPS

1. `configure terminal`
2. `authentication mac-move permit`
3. `end`
4. `show running-config`
5. `copy running-config startup-config`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	<b>authentication mac-move permit</b> <b>Example:</b> Device(config)# <code>authentication mac-move permit</code>	Enables MAC move on the switch. Default is deny. In Session Aware Networking mode, the default CLI is <b>access-session mac-move deny</b> . To enable Mac Move in Session Aware Networking, use the <b>no access-session mac-move</b> global configuration command.
Step 3	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 4	<b>show running-config</b> <b>Example:</b> Device# <code>show running-config</code>	Verifies your entries.
Step 5	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Enabling MAC Replace

MAC replace allows a host to replace an authenticated host on a port.

Beginning in privileged EXEC mode, follow these steps to enable MAC replace on an interface. This procedure is optional.

## SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `authentication violation {protect | replace | restrict | shutdown}`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <code>interface gigabitethernet2/0/2</code>	Specifies the port to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>authentication violation {protect   replace   restrict   shutdown}</b> <b>Example:</b> Device(config-if)# <code>authentication violation replace</code>	Use the <b>replace</b> keyword to enable MAC replace on the interface. The port removes the current session and initiates authentication with the new host.  The other keywords have these effects: <ul style="list-style-type: none"> <li>• <b>protect</b>: the port drops packets with unexpected MAC addresses without generating a system message.</li> <li>• <b>restrict</b>: violating packets are dropped by the CPU and a system message is generated.</li> <li>• <b>shutdown</b>: the port is error disabled when it receives an unexpected MAC address.</li> </ul>
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b> Device# <code>show running-config</code>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Configuring 802.1x Accounting

Enabling AAA system accounting with 802.1x accounting allows system reload events to be sent to the accounting RADIUS server for logging. The server can then infer that all active 802.1x sessions are closed.

Because RADIUS uses the unreliable UDP transport protocol, accounting messages might be lost due to poor network conditions. If the switch does not receive the accounting response message from the RADIUS server after a configurable number of retransmissions of an accounting request, this system message appears:

```
Accounting message %s for session %s failed to receive Accounting Response.
```

When the stop message is not sent successfully, this message appears:

```
00:09:55: %RADIUS-4-RADIUS_DEAD: RADIUS server 172.20.246.201:1645,1646 is not responding.
```

**Note** You must configure the RADIUS server to perform accounting tasks, such as logging start, stop, and interim-update messages and time stamps. To turn on these functions, enable logging of “Update/Watchdog packets from this AAA client” in your RADIUS server Network Configuration tab. Next, enable “CVS RADIUS Accounting” in your RADIUS server System Configuration tab.

Beginning in privileged EXEC mode, follow these steps to configure 802.1x accounting after AAA is enabled on your switch. This procedure is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **aaa accounting dot1x default start-stop group radius**
4. **aaa accounting system default start-stop group radius**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <b>interface gigabitethernet1/0/3</b>	Specifies the port to be configured, and enter interface configuration mode.

	Command or Action	Purpose
<b>Step 3</b>	<b>aaa accounting dot1x default start-stop group radius</b> <b>Example:</b> <pre>Device(config-if)# aaa accounting dot1x default start-stop group radius</pre>	Enables 802.1x accounting using the list of all RADIUS servers.
<b>Step 4</b>	<b>aaa accounting system default start-stop group radius</b> <b>Example:</b> <pre>Device(config-if)# aaa accounting system default start-stop group radius</pre>	(Optional) Enables system accounting (using the list of all RADIUS servers) and generates system accounting reload event messages when the switch reloads.
<b>Step 5</b>	<b>end</b> <b>Example:</b> <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show running-config</b> <b>Example:</b> <pre>Device# show running-config</pre>	Verifies your entries.
<b>Step 7</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring a Guest VLAN

When you configure a guest VLAN, clients that are not 802.1x-capable are put into the guest VLAN when the server does not receive a response to its EAP request/identity frame. Clients that are 802.1x-capable but that fail authentication are not granted network access. The switch supports guest VLANs in single-host or multiple-hosts mode.

Beginning in privileged EXEC mode, follow these steps to configure a guest VLAN. This procedure is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. Use one of the following:
  - **switchport mode access**
  - **switchport mode private-vlan host**

4. `authentication event no-response action authorize vlan vlan-id`
5. `end`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
Step 2	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <code>interface gigabitethernet2/0/2</code>	Specifies the port to be configured, and enter interface configuration mode.
Step 3	Use one of the following: <ul style="list-style-type: none"> <li>• <code>switchport mode access</code></li> <li>• <code>switchport mode private-vlan host</code></li> </ul> <b>Example:</b> Device(config-if)# <code>switchport mode private-vlan host</code>	<ul style="list-style-type: none"> <li>• Sets the port to access mode.</li> <li>• Configures the Layer 2 port as a private-VLAN host port.</li> </ul>
Step 4	<b>authentication event no-response action authorize vlan <i>vlan-id</i></b> <b>Example:</b> Device(config-if)# <code>authentication event no-response action authorize vlan 2</code>	Specifies an active VLAN as an 802.1x guest VLAN. The range is 1 to 4094.  You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x guest VLAN.
Step 5	<b>end</b> <b>Example:</b> Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.

## Configuring a Restricted VLAN

When you configure a restricted VLAN on a switch stack or a switch, clients that are IEEE 802.1x-compliant are moved into the restricted VLAN when the authentication server does not receive a valid username and password. The switch supports restricted VLANs only in single-host mode.

Beginning in privileged EXEC mode, follow these steps to configure a restricted VLAN. This procedure is optional.

## SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. Use one of the following:
  - **switchport mode access**
  - **switchport mode private-vlan host**
4. **authentication port-control auto**
5. **authentication event fail action authorize vlan *vlan-id***
6. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <b>interface gigabitethernet2/0/2</b>	Specifies the port to be configured, and enter interface configuration mode.
<b>Step 3</b>	Use one of the following: <ul style="list-style-type: none"> <li>• <b>switchport mode access</b></li> <li>• <b>switchport mode private-vlan host</b></li> </ul> <b>Example:</b> Device(config-if)# <b>switchport mode access</b>	<ul style="list-style-type: none"> <li>• Sets the port to access mode.</li> <li>• Configures the Layer 2 port as a private-VLAN host port.</li> </ul>
<b>Step 4</b>	<b>authentication port-control auto</b> <b>Example:</b> Device(config-if)# <b>authentication port-control auto</b>	Enables 802.1x authentication on the port.
<b>Step 5</b>	<b>authentication event fail action authorize vlan <i>vlan-id</i></b> <b>Example:</b> Device(config-if)# <b>authentication event fail action authorize vlan 2</b>	Specifies an active VLAN as an 802.1x restricted VLAN. The range is 1 to 4094.  You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN.

	Command or Action	Purpose
Step 6	<b>end</b> <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring Number of Authentication Attempts on a Restricted VLAN

You can configure the maximum number of authentication attempts allowed before a user is assigned to the restricted VLAN by using the **authentication event retry *retry count*** interface configuration command. The range of allowable authentication attempts is 1 to 3. The default is 3 attempts.

Beginning in privileged EXEC mode, follow these steps to configure the maximum number of allowed authentication attempts. This procedure is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. Use one of the following:
  - **switchport mode access**
  - **switchport mode private-vlan host**
4. **authentication port-control auto**
5. **authentication event fail action authorize vlan *vlan-id***
6. **authentication event retry *retry count***
7. **end**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 2	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <b>interface gigabitethernet2/0/3</b>	Specifies the port to be configured, and enter interface configuration mode.
Step 3	Use one of the following: <ul style="list-style-type: none"> <li>• <b>switchport mode access</b></li> <li>• <b>switchport mode private-vlan host</b></li> </ul> <b>Example:</b>	<ul style="list-style-type: none"> <li>• Sets the port to access mode.</li> <li>• Configures the Layer 2 port as a private-VLAN host port.</li> </ul>

	Command or Action	Purpose
	or  Device(config-if)# <b>switchport mode access</b>	
<b>Step 4</b>	<b>authentication port-control auto</b>  <b>Example:</b>  Device(config-if)# <b>authentication port-control auto</b>	Enables 802.1x authentication on the port.
<b>Step 5</b>	<b>authentication event fail action authorize vlan <i>vlan-id</i></b>  <b>Example:</b>  Device(config-if)# <b>authentication event fail action authorize vlan 8</b>	Specifies an active VLAN as an 802.1x restricted VLAN. The range is 1 to 4094.  You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN.
<b>Step 6</b>	<b>authentication event retry <i>retry count</i></b>  <b>Example:</b>  Device(config-if)# <b>authentication event retry 2</b>	Specifies a number of authentication attempts to allow before a port moves to the restricted VLAN. The range is 1 to 3, and the default is 3.
<b>Step 7</b>	<b>end</b>  <b>Example:</b>  Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring 802.1x Inaccessible Authentication Bypass with Critical Voice VLAN

Beginning in privileged EXEC mode, follow these steps to configure critical voice VLAN on a port and enable the inaccessible authentication bypass feature.

### SUMMARY STEPS

1. **configure terminal**
2. **aaa new-model**
3. **radius-server dead-criteria {time *seconds* } [*tries number*]**
4. **radius-server deadtime *minutes***
5. **radius server *server name***
6. **address {*ipv4* | *ipv6*} *ip address* **auth-port** *port\_number* **acct-port** *port\_number***
7. **key *string***
8. **exit**

9. `dot1x critical {eapol | recovery delay milliseconds}`
10. `interface interface-id`
11. `authentication event server dead action {authorize | reinitialize} vlan vlan-id`
12. `switchport voice vlan vlan-id`
13. `authentication event server dead action authorize voice`
14. `show authentication interface interface-id`
15. `copy running-config startup-config`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters the global configuration mode.
Step 2	<b>aaa new-model</b> <b>Example:</b> <pre>Device(config)# aaa new-model</pre>	Enables AAA.
Step 3	<b>radius-server dead-criteria {time <i>seconds</i> } [tries <i>number</i>]</b> <b>Example:</b> <pre>Device(config)# radius-server dead-criteria time 20 tries 10</pre>	Sets the conditions that determine when a RADIUS server is considered un-available or down (dead). <ul style="list-style-type: none"> <li>• <b>time</b>— 1 to 120 seconds. The switch dynamically determines a default <i>seconds</i> value between 10 and 60.</li> <li>• <b>number</b>—1 to 100 tries. The switch dynamically determines a default <i>triesnumber</i> between 10 and 100.</li> </ul>
Step 4	<b>radius-server deadtime <i>minutes</i></b> <b>Example:</b> <pre>Device(config)# radius-server deadtime 60</pre>	(Optional) Sets the number of minutes during which a RADIUS server is not sent requests. The range is from 0 to 1440 minutes (24 hours). The default is 0 minutes.
Step 5	<b>radius server <i>server name</i></b> <b>Example:</b> <pre>Device(config)# radius server rsim address ipv4 124.2.2.12</pre>	(Optional) Specifies the IP address of the RADIUS server.
Step 6	<b>address {ipv4   ipv6} <i>ip address</i> auth-port <i>port_number</i> acct-port <i>port_number</i></b> <b>Example:</b>	Configures the IP address for the RADIUS server.

	Command or Action	Purpose
	Device(config-radius-server)# <b>address ipv4 10.0.1.2 auth-port 1550 acct-port 1560</b>	
<b>Step 7</b>	<b>key string</b> <b>Example:</b> Device(config-radius-server)# <b>key rad123</b>	(Optional) Specifies the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.
<b>Step 8</b>	<b>exit</b> <b>Example:</b> Device(config-radius-server)# <b>exit</b>	Exits the RADIUS server mode and enters the global configuration mode.
<b>Step 9</b>	<b>dot1x critical {eapol   recovery delay milliseconds}</b> <b>Example:</b> Device(config)# <b>dot1x critical eapol</b> (config)# <b>dot1x critical recovery delay 2000</b>	(Optional) Configure the parameters for inaccessible authentication bypass: <ul style="list-style-type: none"> <li>• <b>eapol</b>—Specify that the switch sends an EAPOL-Success message when the switch successfully authenticates the critical port.</li> <li>• <b>recovery delay milliseconds</b>—Set the recovery delay period during which the switch waits to re-initialize a critical port when a RADIUS server that was unavailable becomes available. The range is from 1 to 10000 milliseconds. The default is 1000 milliseconds (a port can be re-initialized every second).</li> </ul>
<b>Step 10</b>	<b>interface interface-id</b> <b>Example:</b> Device(config)# <b>interface gigabitethernet 1/0/1</b>	Specify the port to be configured, and enter interface configuration mode.
<b>Step 11</b>	<b>authentication event server dead action {authorize   reinitialize} vlan vlan-id]</b> <b>Example:</b> Device(config-if)# <b>authentication event server dead action reinitialicze vlan 20</b>	Use these keywords to move hosts on the port if the RADIUS server is unreachable: <ul style="list-style-type: none"> <li>• <b>authorize</b>—Move any new hosts trying to authenticate to the user-specified critical VLAN.</li> <li>• <b>reinitialize</b>—Move all authorized hosts on the port to the user-specified critical VLAN.</li> </ul>
<b>Step 12</b>	<b>switchport voice vlan vlan-id</b> <b>Example:</b> Device(config-if)# <b>switchport voice vlan</b>	Specifies the voice VLAN for the port. The voice VLAN cannot be the same as the critical data VLAN configured in Step 6.

	Command or Action	Purpose
Step 13	<b>authentication event server dead action authorize voice</b> <b>Example:</b> <pre>Device(config-if)# authentication event server dead action authorize voice</pre>	Configures critical voice VLAN to move data traffic on the port to the voice VLAN if the RADIUS server is unreachable.
Step 14	<b>show authentication interface <i>interface-id</i></b> <b>Example:</b> <pre>Device(config-if)# do show authentication interface gigabit 1/0/1</pre>	(Optional) Verify your entries.
Step 15	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Device(config-if)# do copy running-config startup-config</pre>	(Optional) Verify your entries.

### Example

To return to the RADIUS server default settings, use the **no radius-server dead-criteria**, the **no radius-server deadtime**, and the **no radius server** global configuration commands. To disable inaccessible authentication bypass, use the **no authentication event server dead action** interface configuration command. To disable critical voice VLAN, use the **no authentication event server dead action authorize voice** interface configuration command.

## Example of Configuring Inaccessible Authentication Bypass

This example shows how to configure the inaccessible authentication bypass feature:

```
Device(config)# radius-server dead-criteria time 30 tries 20
Device(config)# radius-server deadtime 60
Device(config)# radius server server1
Device(config-radius-server)# address ipv4 172.29.36.49 acct-port 1618 auth-port 1612
Device(config-radius-server)# key abc1234
Device(config-radius-server)# exit
Device(config)# dot1x critical eapol
Device(config)# dot1x critical recovery delay 2000
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# dot1x critical
Device(config-if)# dot1x critical recovery action reinitialize
Device(config-if)# dot1x critical vlan 20
Device(config-if)# end
```

## Configuring 802.1x Authentication with WoL

Beginning in privileged EXEC mode, follow these steps to enable 802.1x authentication with WoL. This procedure is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **authentication control-direction {both | in}**
4. **end**
5. **show authentication sessions interface *interface-id***
6. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <b>interface gigabitethernet2/0/3</b>	Specifies the port to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>authentication control-direction {both   in}</b> <b>Example:</b> Device(config-if)# <b>authentication control-direction both</b>	Enables 802.1x authentication with WoL on the port, and use these keywords to configure the port as bidirectional or unidirectional. <ul style="list-style-type: none"> <li>• <b>both</b>—Sets the port as bidirectional. The port cannot receive packets from or send packets to the host. By default, the port is bidirectional.</li> <li>• <b>in</b>—Sets the port as unidirectional. The port can send packets to the host but cannot receive packets from the host.</li> </ul>
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show authentication sessions interface <i>interface-id</i></b> <b>Example:</b>	Verifies your entries.

	Command or Action	Purpose
	Device# <code>show authentication sessions interface gigabitethernet2/0/3</code>	
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Configuring MAC Authentication Bypass

Beginning in privileged EXEC mode, follow these steps to enable MAC authentication bypass. This procedure is optional.

### SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **authentication port-control auto**
4. **mab** [*cap*]
5. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Device(config)# <code>interface gigabitethernet2/0/1</code>	Specifies the port to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>authentication port-control auto</b> <b>Example:</b> Device(config-if)# <code>authentication port-control auto</code>	Enables 802.1x authentication on the port.
<b>Step 4</b>	<b>mab</b> [ <i>cap</i> ] <b>Example:</b>	Enables MAC authentication bypass. (Optional) Use the <b>cap</b> keyword to configure the switch to use EAP for authorization.

	Command or Action	Purpose
	Device(config-if) # <b>mab</b>	
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-if) # <b>end</b>	Returns to privileged EXEC mode.

## Configuring 802.1x User Distribution

Beginning in privileged EXEC mode, follow these steps to configure a VLAN group and to map a VLAN to it:

### SUMMARY STEPS

1. **configure terminal**
2. **vlan group** *vlan-group-name* **vlan-list** *vlan-list*
3. **end**
4. **no vlan group** *vlan-group-name* **vlan-list** *vlan-list*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>vlan group</b> <i>vlan-group-name</i> <b>vlan-list</b> <i>vlan-list</i> <b>Example:</b> Device(config) # <b>vlan group eng-dept vlan-list 10</b>	Configures a VLAN group, and maps a single VLAN or a range of VLANs to it.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device(config) # <b>end</b>	Returns to privileged EXEC mode.
<b>Step 4</b>	<b>no vlan group</b> <i>vlan-group-name</i> <b>vlan-list</b> <i>vlan-list</i> <b>Example:</b> Device(config) # <b>no vlan group eng-dept vlan-list</b>	Clears the VLAN group configuration or elements of the VLAN group configuration.

	Command or Action	Purpose
	10	

## Example of Configuring VLAN Groups

This example shows how to configure the VLAN groups, to map the VLANs to the groups, to and verify the VLAN group configurations and mapping to the specified VLANs:

```
Device(config)# vlan group eng-dept vlan-list 10

Device(config)# show vlan group group-name eng-dept
Group Name Vlans Mapped

eng-dept 10

Device(config)# show dot1x vlan-group all
Group Name Vlans Mapped

eng-dept 10
hr-dept 20
```

This example shows how to add a VLAN to an existing VLAN group and to verify that the VLAN was added:

```
Device(config)# vlan group eng-dept vlan-list 30
Device(config)# show vlan group eng-dept
Group Name Vlans Mapped

eng-dept 10,30
```

This example shows how to remove a VLAN from a VLAN group:

```
Device# no vlan group eng-dept vlan-list 10
```

This example shows that when all the VLANs are cleared from a VLAN group, the VLAN group is cleared:

```
Device(config)# no vlan group eng-dept vlan-list 30
Vlan 30 is successfully cleared from vlan group eng-dept.

Device(config)# show vlan group group-name eng-dept
```

This example shows how to clear all the VLAN groups:

```
Device(config)# no vlan group end-dept vlan-list all
Device(config)# show vlan-group all
```

For more information about these commands, see the *Cisco IOS Security Command Reference*.

## Configuring NAC Layer 2 802.1x Validation

You can configure NAC Layer 2 802.1x validation, which is also referred to as 802.1x authentication with a RADIUS server.

Beginning in privileged EXEC mode, follow these steps to configure NAC Layer 2 802.1x validation. The procedure is optional.

## SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **switchport mode access**
4. **authentication event no-response action authorize vlan *vlan-id***
5. **authentication periodic**
6. **authentication timer reauthenticate**
7. **end**
8. **show authentication sessions interface *interface-id***
9. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <b>interface gigabitethernet2/0/3</b>	Specifies the port to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>switchport mode access</b> <b>Example:</b> Device(config-if)# <b>switchport mode access</b>	Sets the port to access mode only if you configured the RADIUS server.
<b>Step 4</b>	<b>authentication event no-response action authorize vlan <i>vlan-id</i></b> <b>Example:</b> Device(config-if)# <b>authentication event no-response action authorize vlan 8</b>	Specifies an active VLAN as an 802.1x guest VLAN. The range is 1 to 4094.  You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN, or a voice VLAN as an 802.1x guest VLAN.
<b>Step 5</b>	<b>authentication periodic</b> <b>Example:</b> Device(config-if)# <b>authentication periodic</b>	Enables periodic re-authentication of the client, which is disabled by default.

	Command or Action	Purpose
Step 6	<b>authentication timer reauthenticate</b> <b>Example:</b> <pre>Device(config-if)# authentication timer reauthenticate</pre>	Sets re-authentication attempt for the client (set to one hour).  This command affects the behavior of the switch only if periodic re-authentication is enabled.
Step 7	<b>end</b> <b>Example:</b> <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 8	<b>show authentication sessions interface <i>interface-id</i></b> <b>Example:</b> <pre>Device# show authentication sessions interface gigabitethernet2/0/3</pre>	Verifies your entries.
Step 9	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring 802.1x Authentication with Downloadable ACLs and Redirect URLs

In addition to configuring 802.1x authentication on the switch, you need to configure the ACS. For more information, see the *Configuration Guide for Cisco Secure ACS 4.2*:  
[http://www.cisco.com/en/US/docs/net\\_mgmt/cisco\\_secure\\_access\\_control\\_server\\_for\\_windows/4.2/configuration/guide/acs\\_config.pdf](http://www.cisco.com/en/US/docs/net_mgmt/cisco_secure_access_control_server_for_windows/4.2/configuration/guide/acs_config.pdf)

**Note** You must configure a downloadable ACL on the ACS before downloading it to the switch.

After authentication on the port, you can use the **show ip access-list** privileged EXEC command to display the downloaded ACLs on the port.

### Configuring Downloadable ACLs

The policies take effect after client authentication and the client IP address addition to the IP device tracking table. The switch then applies the downloadable ACL to the port.

Beginning in privileged EXEC mode:

#### SUMMARY STEPS

1. **configure terminal**

2. **ip device tracking**
3. **aaa new-model**
4. **aaa authorization network default local group radius**
5. **radius-server vsa send authentication**
6. **interface *interface-id***
7. **ip access-group *acl-id* in**
8. **show running-config interface *interface-id***
9. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>ip device tracking</b> <b>Example:</b> Device(config)# <code>ip device tracking</code>	Sets the ip device tracking table.
<b>Step 3</b>	<b>aaa new-model</b> <b>Example:</b> Device(config)# <code>aaa new-model</code>	Enables AAA.
<b>Step 4</b>	<b>aaa authorization network default local group radius</b> <b>Example:</b> Device(config)# <code>aaa authorization network default local group radius</code>	Sets the authorization method to local. To remove the authorization method, use the <b>no aaa authorization network default local group radius</b> command.
<b>Step 5</b>	<b>radius-server vsa send authentication</b> <b>Example:</b> Device(config)# <code>radius-server vsa send authentication</code>	Configures the radius vsa send authentication.
<b>Step 6</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <code>interface gigabitethernet2/0/4</code>	Specifies the port to be configured, and enter interface configuration mode.

	Command or Action	Purpose
<b>Step 7</b>	<b>ip access-group <i>acl-id</i> in</b> <b>Example:</b> <pre>Device(config-if)# ip access-group default_acl in</pre>	Configures the default ACL on the port in the input direction. <b>Note</b> The <i>acl-id</i> is an access list name or number.
<b>Step 8</b>	<b>show running-config interface <i>interface-id</i></b> <b>Example:</b> <pre>Device(config-if)# show running-config interface gigabitethernet2/0/4</pre>	Verifies your configuration.
<b>Step 9</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Configuring a Downloadable Policy

Beginning in privileged EXEC mode:

### SUMMARY STEPS

1. **configure terminal**
2. **access-list *access-list-number* { deny | permit } { hostname | any | host } log**
3. **interface *interface-id***
4. **ip access-group *acl-id* in**
5. **exit**
6. **aaa new-model**
7. **aaa authorization network default group radius**
8. **ip device tracking**
9. **ip device tracking probe [count | interval | use-svi]**
10. **radius-server vsa send authentication**
11. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters the global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<p><b>access-list</b> <i>access-list-number</i> { <b>deny</b>   <b>permit</b> } { <b>hostname</b>   <b>any</b>   <b>host</b> } <b>log</b></p> <p><b>Example:</b></p> <pre>Device(config)# access-list 1 deny any log</pre>	<p>Defines the default port ACL.</p> <p>The access-list-number is a decimal number from 1 to 99 or 1300 to 1999.</p> <p>Enter <b>deny</b> or <b>permit</b> to specify whether to deny or permit access if conditions are matched.</p> <p>The source is the source address of the network or host that sends a packet, such as this:</p> <ul style="list-style-type: none"> <li>• <b>hostname</b>: The 32-bit quantity in dotted-decimal format.</li> <li>• <b>any</b>: The keyword any as an abbreviation for source and source-wildcard value of 0.0.0.0 255.255.255.255. You do not need to enter a source-wildcard value.</li> <li>• <b>host</b>: The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0.</li> </ul> <p>(Optional) Applies the source-wildcard wildcard bits to the source.</p> <p>(Optional) Enters log to cause an informational logging message about the packet that matches the entry to be sent to the console.</p>
<b>Step 3</b>	<p><b>interface</b> <i>interface-id</i></p> <p><b>Example:</b></p> <pre>Device(config)# interface gigabitethernet2/0/2</pre>	Enters interface configuration mode.
<b>Step 4</b>	<p><b>ip access-group</b> <i>acl-id</i> <b>in</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# ip access-group default_acl in</pre>	<p>Configures the default ACL on the port in the input direction.</p> <p><b>Note</b> The acl-id is an access list name or number.</p>
<b>Step 5</b>	<p><b>exit</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# exit</pre>	Returns to global configuration mode.
<b>Step 6</b>	<p><b>aaa new-model</b></p> <p><b>Example:</b></p> <pre>Device(config)# aaa new-model</pre>	Enables AAA.

	Command or Action	Purpose
Step 7	<b>aaa authorization network default group radius</b> <b>Example:</b> <pre>Device(config)# aaa authorization network default group radius</pre>	Sets the authorization method to local. To remove the authorization method, use the <b>no aaa authorization network default group radius</b> command.
Step 8	<b>ip device tracking</b> <b>Example:</b> <pre>Device(config)# ip device tracking</pre>	Enables the IP device tracking table.  To disable the IP device tracking table, use the <b>no ip device tracking</b> global configuration commands.
Step 9	<b>ip device tracking probe [count   interval   use-svi]</b> <b>Example:</b> <pre>Device(config)# ip device tracking probe count</pre>	(Optional) Configures the IP device tracking table: <ul style="list-style-type: none"> <li>• <b>count</b> <i>count</i>—Sets the number of times that the switch sends the ARP probe. The range is from 1 to 5. The default is 3.</li> <li>• <b>interval</b> <i>interval</i>—Sets the number of seconds that the switch waits for a response before resending the ARP probe. The range is from 30 to 300 seconds. The default is 30 seconds.</li> <li>• <b>use-svi</b>—Uses the switch virtual interface (SVI) IP address as source of ARP probes.</li> </ul>
Step 10	<b>radius-server vsa send authentication</b> <b>Example:</b> <pre>Device(config)# radius-server vsa send authentication</pre>	Configures the network access server to recognize and use vendor-specific attributes.  <b>Note</b> The downloadable ACL must be operational.
Step 11	<b>end</b> <b>Example:</b> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

## Configuring VLAN ID-based MAC Authentication

Beginning in privileged EXEC mode, follow these steps:

### SUMMARY STEPS

1. **configure terminal**
2. **mab request format attribute 32 vlan access-vlan**
3. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>mab request format attribute 32 vlan access-vlan</b> <b>Example:</b> Device(config)# <code>mab request format attribute 32 vlan access-vlan</code>	Enables VLAN ID-based MAC authentication.
<b>Step 3</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Configuring Flexible Authentication Ordering

The examples used in the instructions below changes the order of Flexible Authentication Ordering so that MAB is attempted before IEEE 802.1X authentication (dot1x). MAB is configured as the first authentication method, so MAB will have priority over all other authentication methods.

**Note** Before changing the default order and priority of these authentication methods, however, you should understand the potential consequences of those changes. See [http://www.cisco.com/en/US/prod/collateral/iosswrel/ps6537/ps6586/ps6638/application\\_note\\_c27-573287\\_ps6638\\_Products\\_White\\_Paper.html](http://www.cisco.com/en/US/prod/collateral/iosswrel/ps6537/ps6586/ps6638/application_note_c27-573287_ps6638_Products_White_Paper.html) for details.

Beginning in privileged EXEC mode, follow these steps:

## SUMMARY STEPS

1. **configure terminal**
2. **interface** *interface-id*
3. **switchport mode access**
4. **authentication order** [ dot1x | mab ] | {webauth}
5. **authentication priority** [ dot1x | mab ] | {webauth}
6. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b>  Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b>  Device(config)# <code>interface gigabitethernet 1/0/1</code>	Specifies the port to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>switchport mode access</b> <b>Example:</b>  Device(config-if)# <code>switchport mode access</code>	Sets the port to access mode only if you previously configured the RADIUS server.
<b>Step 4</b>	<b>authentication order [ dot1x   mab ]   {webauth}</b> <b>Example:</b>  Device(config-if)# <code>authentication order mab dot1x</code>	(Optional) Sets the order of authentication methods used on a port.
<b>Step 5</b>	<b>authentication priority [ dot1x   mab ]   {webauth}</b> <b>Example:</b>  Device(config-if)# <code>authentication priority mab dot1x</code>	(Optional) Adds an authentication method to the port-priority list.
<b>Step 6</b>	<b>end</b> <b>Example:</b>  Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.

## Configuring Open1x

Beginning in privileged EXEC mode, follow these steps to enable manual control of the port authorization state:

## SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **switchport mode access**
4. **authentication control-direction {both | in}**
5. **authentication fallback *name***
6. **authentication host-mode [multi-auth | multi-domain | multi-host | single-host]**
7. **authentication open**
8. **authentication order [ dot1x | mab ] | {webauth}**
9. **authentication periodic**
10. **authentication port-control {auto | force-authorized | force-un authorized}**
11. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <b>interface gigabitethernet 1/0/1</b>	Specifies the port to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>switchport mode access</b> <b>Example:</b> Device(config-if)# <b>switchport mode access</b>	Sets the port to access mode only if you configured the RADIUS server.
<b>Step 4</b>	<b>authentication control-direction {both   in}</b> <b>Example:</b> Device(config-if)# <b>authentication control-direction both</b>	(Optional) Configures the port control as unidirectional or bidirectional.
<b>Step 5</b>	<b>authentication fallback <i>name</i></b> <b>Example:</b> Device(config-if)# <b>authentication fallback profile1</b>	(Optional) Configures a port to use web authentication as a fallback method for clients that do not support 802.1x authentication.

	Command or Action	Purpose
Step 6	<b>authentication host-mode</b> [multi-auth   multi-domain   multi-host   single-host] <b>Example:</b> <pre>Device(config-if) # authentication host-mode multi-auth</pre>	(Optional) Sets the authorization manager mode on a port.
Step 7	<b>authentication open</b> <b>Example:</b> <pre>Device(config-if) # authentication open</pre>	(Optional) Enables or disable open access on a port.
Step 8	<b>authentication order</b> [ dot1x   mab ]   {webauth} <b>Example:</b> <pre>Device(config-if) # authentication order dot1x webauth</pre>	(Optional) Sets the order of authentication methods used on a port.
Step 9	<b>authentication periodic</b> <b>Example:</b> <pre>Device(config-if) # authentication periodic</pre>	(Optional) Enables or disable reauthentication on a port.
Step 10	<b>authentication port-control</b> {auto   force-authorized   force-un authorized} <b>Example:</b> <pre>Device(config-if) # authentication port-control auto</pre>	(Optional) Enables manual control of the port authorization state.
Step 11	<b>end</b> <b>Example:</b> <pre>Device(config-if) # end</pre>	Returns to privileged EXEC mode.

## Disabling 802.1x Authentication on the Port

You can disable 802.1x authentication on the port by using the **no dot1x pae** interface configuration command.

Beginning in privileged EXEC mode, follow these steps to disable 802.1x authentication on the port. This procedure is optional.

## SUMMARY STEPS

1. **configure terminal**
2. **interface *interface-id***
3. **switchport mode access**
4. **no dot1x pae authenticator**
5. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <b>interface gigabitethernet2/0/1</b>	Specifies the port to be configured, and enter interface configuration mode.
<b>Step 3</b>	<b>switchport mode access</b> <b>Example:</b> Device(config-if)# <b>switchport mode access</b>	(Optional) Sets the port to access mode only if you configured the RADIUS server.
<b>Step 4</b>	<b>no dot1x pae authenticator</b> <b>Example:</b> Device(config-if)# <b>no dot1x pae authenticator</b>	Disables 802.1x authentication on the port.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-if)# <b>end</b>	Returns to privileged EXEC mode.

## Resetting the 802.1x Authentication Configuration to the Default Values

Beginning in privileged EXEC mode, follow these steps to reset the 802.1x authentication configuration to the default values. This procedure is optional.

## SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `dot1x default`
4. `end`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
Step 2	<b>interface interface-id</b> <b>Example:</b> Device(config)# <code>interface gigabitethernet1/0/2</code>	Enters interface configuration mode, and specify the port to be configured.
Step 3	<b>dot1x default</b> <b>Example:</b> Device(config-if)# <code>dot1x default</code>	Resets the 802.1x parameters to the default values.
Step 4	<b>end</b> <b>Example:</b> Device(config-if)# <code>end</code>	Returns to privileged EXEC mode.

## Monitoring 802.1x Statistics and Status

Table 145: Privileged EXEC show Commands

Command	Purpose
<code>show dot1x all statistics</code>	Displays 802.1x statistics for all ports
<code>show dot1x interface interface-id statistics</code>	Displays 802.1x statistics for a specific port
<code>show dot1x all [count   details   statistics   summary]</code>	Displays the 802.1x administrative and operational status for a switch
<code>show dot1x interface interface-id</code>	Displays the 802.1x administrative and operational status for a specific port

Table 146: Global Configuration Commands

Command	Purpose
<b>no dot1x logging verbose</b>	Filters verbose 802.1x authentication messages (beginning with Cisco IOS Release 12.2(55)SE)

For detailed information about the fields in these displays, see the command reference for this release.

## CHAPTER 89

# Configuring Device Sensor

---

- [About Device Sensor, on page 1819](#)
- [MSP-IOS Sensor Device Classifier Interaction, on page 1820](#)
- [Configuring Device Sensor, on page 1821](#)
- [Configuration Examples for the Device Sensor Feature, on page 1826](#)
- [Feature Information for Device Sensor, on page 1827](#)

## About Device Sensor

Device Sensor uses protocols such as Cisco Discovery Protocol (CDP), Link Layer Discovery Protocol (LLDP), and DHCP to obtain endpoint information from network devices and make this information available to its clients. Device Sensor has internal clients, such as the embedded Device Classifier (local analyzer), Auto Smartports (ASP), MediaNet Service Interface Media Services Proxy, and EnergyWise. Device Sensor also has an external client, Identity Services Engine (ISE), which uses RADIUS accounting to receive and analyze endpoint data. When integrated with ISE, Device Sensor provides central policy management and device-profiling capabilities.

---

**Note** Cisco Identity Services Engine (ISE) based profiling is not supported on the LAN Base image.

---

Device profiling capability consists of two parts:

- Collector--Gathers endpoint data from network devices.
- Analyzer--Processes the data and determines the type of device.

Device Sensor represents the embedded collector functionality. The following illustration shows a Device Sensor in the context of its internal clients and the ISE

Figure 111: Device Sensor Clients

Client notifications and accounting messages that contain profiling data and other session-related data are generated and sent to the internal clients and the ISE. By default, client notifications and accounting events are generated only when an incoming packet includes a Type-Length-Value (TLV) that has not previously been received within a given access session. You can enable client notifications and accounting events for TLV changes; that is, when a previously received TLV is received with a different value.

Device Sensor port security protects a switch from consuming memory and crashing during deliberate or unintentional denial-of-service (DoS)-type attacks. Device Sensor limits the maximum number of device monitoring sessions to 32 per port. While hosts are inactive, the age session limit is 12 hours.

## MSP-IOS Sensor Device Classifier Interaction

### Note

To enable MSP, you must configure the profile flow command. Once done, when SIP, H323, or mDNS traffic are present, appropriate (SIP, H323, or mDNS) TLV notifications are sent to the IOS sensor.

MSP (Media Service Proxy) offers bandwidth reservation for audio or video flows and Metadata services to 3rd-party endpoints. To offer and install Media services, MSP must identify flow attributes and device details. MSP device identification requires automatic identification of various media end points in the network, thereby avoiding any change to the installed end point base. To offer MSP device discovery services, MSP leverages current IOS sensor capability for device classification. (Starting with Release IOS XE 3.3.0SG and IOS 15.1(1)SG, IOS sensor can be used to perform device identification. MSP uses the same functionality with the addition of SIP, H323, and Multicast DNS (mDNS) protocols.) Starting with Release IOS XE 3.4.0SG

and IOS 15.1(2)SG, MSP offers Media services to two kinds of media endpoints: IP Surveillance Cameras and Video-Conferencing Endpoints. Surveillance cameras are identified using mDNS protocol whereas Video-conference-Endpoints are identified using SIP and H.323 protocols.

mDNS compatible devices (Axis, Pelco cameras etc) send mDNS messages for DNS service discovery to a multicast IP address (224.0.0.251) on a standard mDNS port 5353. The mDNS client module listens to this UDP port, receives the mDNS message, and sends it in TLV format to the mDNS IOS sensor shim for further device classification. The module parses the mDNS query and Answer messages fields to create these TLVs.

A Session Initiation Protocol (SIP) registration message is used for SIP based device-discovery and is sent to Cisco Call manager by the SIP Client. A H.225 RAS client registration message is used for H323-based device discovery.

If no Cisco Unified Communicator Manager or GateKeeper exists in the topology, the Endpoint will not generate device Register messages. To handle device discovery in these scenarios, MSP expects the endpoint to make a SIP or H323 call so that MSP snoops the SIP invite or the H323 setup message to identify endpoint details and notify the IOS sensor.

After the IOS sensor receives these protocol details from MSP, the IOS sensor prepares Normalized TLVs, with the new protocols. These protocol details are sent to session manager for further classification.

## Configuring Device Sensor

Device Sensor is enabled by default. Complete the following tasks when you want Device Sensor to include or exclude a list of TLVs (termed filter lists) for a particular protocol.

- Note** If you do not perform any Device Sensor configuration tasks, the following TLVs are included by default:
- CDP filter--secondport-status-type and powernet-event-type (types 28 and 29)
  - LLDP filter--organizationally-specific (type 127)
  - DHCP filter--message-type (type 53)

## Enabling MSP

You must configure the MSP profile flow command to activate the MSP platform Packet parser. This is because the MSP device handler is tightly coupled with MSP flow parser. Not enabling this command means that MSP will not send SIP, H323 notifications to the IOS sensor.

To enable MSP, follow these steps, beginning in privileged EXEC mode:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	configure terminal  <b>Example:</b> Switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	profile flow <b>Example:</b> Switch(config)# profile flow	Enables MSP.  Use the no form of the <b>profile flow</b> command to disable MSP.
<b>Step 3</b>	end <b>Example:</b> Switch(config)# end	Returns to privileged EXEC mode.

## Enabling Accounting Augmentation

For the Device Sensor protocol data to be added to accounting messages, you must first enable session accounting by using the following standard Authentication, Authorization, and Accounting (AAA) and RADIUS configuration commands:

```
Switch(config)# aaa new-model
Switch(config)# aaa accounting dot1x default start-stop group radius
Switch(config)# radius-server host{hostname|ip-address}[auth-port port-number][acct-port
port-number] [timeout seconds][retransmit retries][key string]
Switch(config)# radius-server vsa send accounting
```

To add Device Sensor protocol data to accounting records, follow these steps, beginning in privileged EXEC mode:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	configure terminal <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	device-sensor accounting <b>Example:</b> Switch(config)# device-sensor accounting	Enables the addition of sensor protocol data to accounting records and also enables the generation of additional accounting events when new sensor data is detected.
<b>Step 3</b>	end <b>Example:</b> Switch(config)# end	Returns to privileged EXEC mode.

## Creating a Cisco Discovery Protocol Filter

To create a CDP filter containing a list of TLVs that can be included or excluded in the Device Sensor output, follow these steps, beginning in privileged EXEC mode:

```
configure terminal
```

### Procedure

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
Step 2	<b>device-sensor filter-list cdp list</b> <i>tlv-list-name</i>	

## Creating an LLDP Filter

To create an LLDP filter containing a list of TLVs that can be included or excluded in the Device Sensor output, follow these steps, beginning in privileged EXEC mode:

### Procedure

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
Step 2	<b>device-sensor filter-list lldp list</b> <i>tlv-list-name</i> <b>Example:</b> Switch(config)# device-sensor filter-list lldp list lldp-list	Creates a TLV list and enters LLDP sensor configuration mode, where you can configure individual TLVs.
Step 3	<b>tlv { name</b> <i>tlv-name</i> <b>  number</b> <i>tlv-number</i> <b>}</b> <b>Example:</b> Switch(config-sensor-cdplist)# tlv number 10	Adds individual LLDP TLVs to the TLV list. You can delete the TLV list without individually removing TLVs from the list by using the <code>no device-sensor filter-list lldp list tlv-list-name</code> command.
Step 4	<b>end</b> <b>Example:</b> Switch(config-sensor-lldplist)# end	Returns to privileged EXEC mode.

## Creating a DHCP Filter

To create a DHCP filter containing a list of DHCP options that can be included or excluded in the Device Sensor output, follow these steps, beginning in privileged EXEC mode:

### Procedure

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
<b>Step 2</b>	<b>device-sensor filter-list dhcp list option-list-name</b> <b>Example:</b> device-sensor filter-list dhcp list option-list-name	Creates an options list and enters DHCP sensor configuration mode, where you can specify individual DHCP options.
<b>Step 3</b>	<b>option { name option-name   number option-number }</b> <b>Example:</b> Switch(config-sensor-dhcplist)# option number 50	Adds individual DHCP options to the option list. You can delete the entire option list without removing options individually from the list by using the no device-sensor filter-list dhcp list option-list-name command.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Switch(config)# end	Returns to privileged EXEC mode.

## Applying a Protocol Filter to the Device Sensor Output

Beginning in privileged EXEC mode, follow these steps to apply a CDP, LLDP, or DHCP filter to the sensor output. The output is session notifications to internal sensor clients and accounting requests to the RADIUS server.

**Note** Only one filter list can be included or excluded at a time.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>device-sensor filter-spec { cdp   dhcp   ldp } { exclude { all   list list-name }   include list list-name }</b> <b>Example:</b> Switch(config)# device-sensor filter-spec cdp include list list1	Applies a specific protocol filter containing a list of protocol TLV fields or DHCP options to the Device Sensor output. <ul style="list-style-type: none"> <li>• <b>cdp</b> –Applies a CDP TLV filter list to the device sensor output</li> <li>• <b>lldp</b> –Applies an LLDP TLV filter list to the device sensor output.</li> <li>• <b>dhcp</b> –Applies a DHCP option filter list to the device sensor output.</li> <li>• <b>exclude</b> –Specifies the TLVs that must be excluded from the device sensor output.</li> <li>• <b>include</b> –Specifies the TLVs that must be included from the device sensor output.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>all</b> –Disables all notifications for the associated protocol.</li> <li>• <b>list list-name</b> –Specifies the protocol TLV filter list name.</li> </ul>
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# end	Returns to privileged EXEC mode.

## Tracking TLV Changes

By default, client notifications and accounting events are generated only when an incoming packet includes a TLV that has not previously been received within a given session.

To enable client notifications and accounting events for TLV changes, follow these steps, beginning in privileged EXEC mode:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Switch# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>device-sensor notify all-changes</b> <b>Example:</b> Switch(config)# device-sensor notify all-changes	Enables client notifications and accounting events for all TLV changes, that is, where either a new TLV is received or a previously received TLV is received with a new value in the context of a given session.  Note Use the default device-sensor notify or the device-sensor notify new-tlvs command to return to the default TLV.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Switch(config)# end	Returns to privileged EXEC mode.

## Verifying the Device Sensor Configuration

To verify the sensor cache entries for all devices, follow these steps, beginning in privileged EXEC mode:

### Procedure

	Command or Action	Purpose
Step 1	<code>show device-sensor cache mac mac-address</code>	Displays sensor cache entries (the list of protocol TLVs or options received from a device) for a specific device. <ul style="list-style-type: none"> <li>• mac-address is the MAC address of the endpoint</li> </ul>
Step 2	<b>show device-sensor cache all</b>  <b>Example:</b> Switch(config)# <code>device-sensor notify all-changes</code>	Displays sensor cache entries for all devices.

## Troubleshooting Commands

The following commands can help troubleshoot Device Sensor.

- `debug device-sensor { errors | events }`
- `debug authentication all`

## Restrictions for Device Sensor

- Only CDP, LLDP, and DHCP protocols are supported.
- The session limit for profiling ports is 32.
- The length of one TLV must not be more than 1024 and the total length of TLVs (combined length of TLVs) of all protocols must not be more than 4096.
- Device Sensor profiles devices that are only one hop away.

## Configuration Examples for the Device Sensor Feature

The following example shows how to create a CDP filter containing a list of TLVs:

```
Switch> enable
Switch# configure terminal
Switch(config)# device-sensor filter-list cdp list cdp-list
Switch(config-sensor-cdplist)# tlv name address-type
Switch(config-sensor-cdplist)# tlv name device-name
Switch(config-sensor-cdplist)# tlv number 34
Switch(config-sensor-cdplist)# end
```

The following example shows how to create an LLDP filter containing a list of TLVs:

```
Switch> enable
Switch# configure terminal
Switch(config)# device-sensor filter-list lldp list lldp-list
```

```
Switch(config-sensor-lldplist)# tlv name chassis-id
Switch(config-sensor-lldplist)# tlv name management-address
Switch(config-sensor-lldplist)# tlv number 28
Switch(config-sensor-lldplist)# end
```

The following example shows how to create a DHCP filter containing a list of options:

```
Switch> enable
Switch# configure terminal
Switch(config)# device-sensor filter-list dhcp list dhcp-list
Switch(config)# device-sensor filter-list dhcp list dhcp-list
Switch(config-sensor-dhcplist)# option name domain-name
Switch(config-sensor-dhcplist)# option name host-name
Switch(config-sensor-dhcplist)# option number 50
Switch(config-sensor-dhcplist)# end
```

The following example shows how to apply a CDP TLV filter list to the Device Sensor output:

```
Switch> enable
Switch# configure terminal
Switch(config)# device-sensor filter-spec cdp include cdp-list1
```

The following example shows how to enable client notifications and accounting events for all TLV changes:

```
Switch> enable
Switch# configure terminal
Switch(config)# device-sensor notify all-changes
```

## Feature Information for Device Sensor

*Table 147: Feature Information for Device Sensor*

Feature Name	Releases	Feature Information
Device Sensor	Cisco IOS XE 3.6E	This feature was introduced.

## CHAPTER 90

# Configuring Web-Based Authentication

This chapter describes how to configure web-based authentication on the switch. It contains these sections:

- [Finding Feature Information, on page 1829](#)
- [Web-Based Authentication Overview, on page 1829](#)
- [How to Configure Web-Based Authentication, on page 1838](#)
- [Monitoring Web-Based Authentication Status, on page 1853](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Web-Based Authentication Overview

Use the web-based authentication feature, known as web authentication proxy, to authenticate end users on host systems that do not run the IEEE 802.1x supplicant.

---

**Note** You can configure web-based authentication on Layer 2 and Layer 3 interfaces.

---

When you initiate an HTTP session, web-based authentication intercepts ingress HTTP packets from the host and sends an HTML login page to the users. The users enter their credentials, which the web-based authentication feature sends to the authentication, authorization, and accounting (AAA) server for authentication.

If authentication succeeds, web-based authentication sends a Login-Successful HTML page to the host and applies the access policies returned by the AAA server.

If authentication fails, web-based authentication forwards a Login-Fail HTML page to the user, prompting the user to retry the login. If the user exceeds the maximum number of attempts, web-based authentication forwards a Login-Expired HTML page to the host, and the user is placed on a watch list for a waiting period.

---

**Note** HTTPS traffic interception for central web authentication redirect is not supported.

---

---

**Note** You should use global parameter-map (for method-type, custom, and redirect) only for using the same web authentication methods like consent, web consent, and webauth, for all the clients and SSIDs. This ensures that all the clients have the same web-authentication method.

If the requirement is to use Consent for one SSID and Web-authentication for another SSID, then you should use two named parameter-maps. You should configure Consent in first parameter-map and configure webauth in second parameter-map.

---

## Device Roles

With web-based authentication, the devices in the network have these specific roles:

- *Client*—The device (workstation) that requests access to the LAN and the services and responds to requests from the switch. The workstation must be running an HTML browser with Java Script enabled.
- *Authentication server*—Authenticates the client. The authentication server validates the identity of the client and notifies the switch that the client is authorized to access the LAN and the switch services or that the client is denied.
- *Switch*—Controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client.

**Figure 112: Web-Based Authentication Device Roles**

This figure shows the roles of these devices in a

## Host Detection

The switch maintains an IP device tracking table to store information about detected hosts.

**Note** By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.

For Layer 2 interfaces, web-based authentication detects IP hosts by using these mechanisms:

- ARP based trigger—ARP redirect ACL allows web-based authentication to detect hosts with a static IP address or a dynamic IP address.
- Dynamic ARP inspection
- DHCP snooping—Web-based authentication is notified when the switch creates a DHCP-binding entry for the host.

## Session Creation

When web-based authentication detects a new host, it creates a session as follows:

- Reviews the exception list.  
If the host IP is included in the exception list, the policy from the exception list entry is applied, and the session is established.
- Reviews for authorization bypass  
If the host IP is not on the exception list, web-based authentication sends a nonresponsive-host (NRH) request to the server.  
If the server response is access accepted, authorization is bypassed for this host. The session is established.
- Sets up the HTTP intercept ACL  
If the server response to the NRH request is access rejected, the HTTP intercept ACL is activated, and the session waits for HTTP traffic from the host.

## Authentication Process

When you enable web-based authentication, these events occur:

- The user initiates an HTTP session.
- The HTTP traffic is intercepted, and authorization is initiated. The switch sends the login page to the user. The user enters a username and password, and the switch sends the entries to the authentication server.
- If the authentication succeeds, the switch downloads and activates the user's access policy from the authentication server. The login success page is sent to the user.
- If the authentication fails, the switch sends the login fail page. The user retries the login. If the maximum number of attempts fails, the switch sends the login expired page, and the host is placed in a watch list. After the watch list times out, the user can retry the authentication process.
- If the authentication server does not respond to the switch, and if an AAA fail policy is configured, the switch applies the failure access policy to the host. The login success page is sent to the user.

- The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface, or when the host does not send any traffic within the idle timeout on a Layer 3 interface.
- The feature applies the downloaded timeout or the locally configured session timeout.

---

**Note** Beginning with Cisco IOS XE Denali 16.1.1 and later, the default session timeout value for web-based authentication on WLC is 1800 seconds. The default session timeout value was infinite seconds, prior to Cisco IOS XE Denali 16.1.1.

---

- If the terminate action is RADIUS, the feature sends a nonresponsive host (NRH) request to the server. The terminate action is included in the response from the server.
- If the terminate action is default, the session is dismantled, and the applied policy is removed.

## Local Web Authentication Banner

With Web Authentication, you can create a default and customized web-browser banners that appears when you log in to a switch.

The banner appears on both the login page and the authentication-result pop-up pages. The default banner messages are as follows:

- *Authentication Successful*
- *Authentication Failed*
- *Authentication Expired*

The Local Web Authentication Banner can be configured in legacy and new-style (Session-aware) CLIs as follows:

- Legacy mode—Use the **ip admission auth-proxy-banner http** global configuration command.
- New-style mode—Use the **parameter-map type webauth global banner** global configuration command.

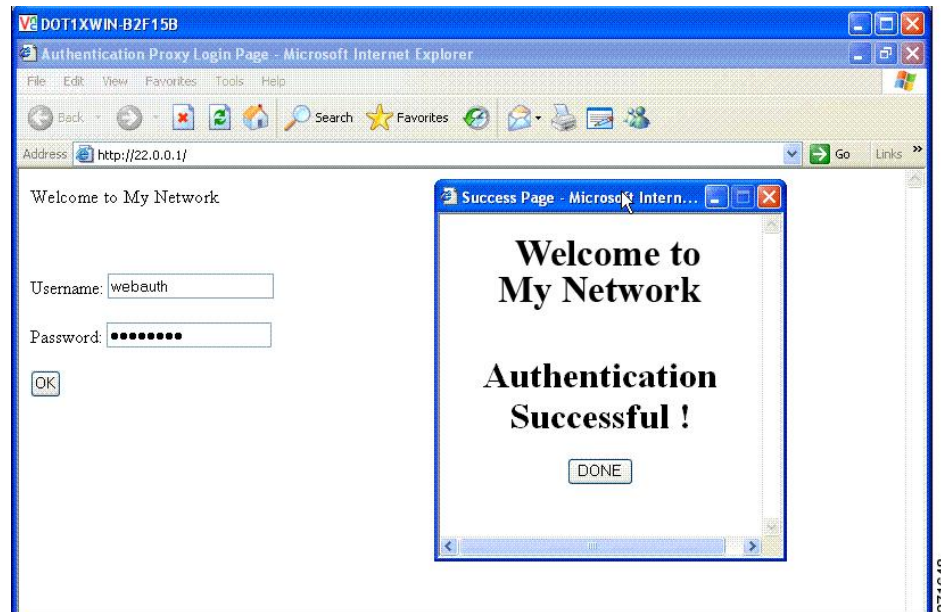

The default banner *Cisco Systems* and *Switch host-name Authentication* appear on the Login Page. *Cisco Systems* appears on the authentication result pop-up page.

**Figure 113: Authentication Successful Banner**

The banner can be customized as follows:

- Add a message, such as switch, router, or company name to the banner:
  - Legacy mode—Use the **ip admission auth-proxy-banner http banner-text** global configuration command.
  - New-style mode—Use the **parameter-map type webauth global banner** global configuration command
- Add a logo or text file to the banner :
  - Legacy mode—Use the **ip admission auth-proxy-banner http file-path** global configuration command.
  - New-style mode—Use the **parameter-map type webauth global banner** global configuration command

Figure 114: Customized Web Banner

If you do not enable a banner, only the username and password dialog boxes appear in the web authentication login screen, and no banner appears when you log into the switch.

Figure 115: Login Screen With No Banner

For more information, see the *Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)* *Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)* and the *Web Authentication Enhancements - Customizing Authentication Proxy Web Pages*.

## Web Authentication Customizable Web Pages

During the web-based authentication process, the switch internal HTTP server hosts four HTML pages to deliver to an authenticating client. The server uses these pages to notify you of these four-authentication process states:

- Login—Your credentials are requested.
- Success—The login was successful.
- Fail—The login failed.
- Expire—The login session has expired because of excessive login failures.

### Guidelines

- You can substitute your own HTML pages for the default internal HTML pages.
- You can use a logo or specify text in the *login*, *success*, *failure*, and *expire* web pages.
- On the banner page, you can specify text in the login page.
- The pages are in HTML.
- You must include an HTML redirect command in the success page to access a specific URL.
- The URL string must be a valid URL (for example, <http://www.cisco.com>). An incomplete URL might cause *page not found* or similar errors on a web browser.
- If you configure web pages for HTTP authentication, they must include the appropriate HTML commands (for example, to set the page time out, to set a hidden password, or to confirm that the same page is not submitted twice).
- The CLI command to redirect users to a specific URL is not available when the configured login form is enabled. The administrator should ensure that the redirection is configured in the web page.
- If the CLI command redirecting users to specific URL after authentication occurs is entered and then the command configuring web pages is entered, the CLI command redirecting users to a specific URL does not take effect.
- Configured web pages can be copied to the switch boot flash or flash.
- On stackable switches, configured pages can be accessed from the flash on the stack master or members.
- The login page can be on one flash, and the success and failure pages can be another flash (for example, the flash on the stack master or a member).
- You must configure all four pages.
- The banner page has no effect if it is configured with the web page.
- All of the logo files (image, flash, audio, video, and so on) that are stored in the system directory (for example, flash, disk0, or disk) and that must be displayed on the login page must use `web_auth_<filename>` as the file name.
- The configured authentication proxy feature supports both HTTP and SSL.

You can substitute your HTML pages for the default internal HTML pages. You can also specify a URL to which users are redirected after authentication occurs, which replaces the internal Success page.

**Figure 116: Customizable Authentication Page**

## Authentication Proxy Web Page Guidelines

When configuring customized authentication proxy web pages, follow these guidelines:

- To enable the custom web pages feature, specify all four custom HTML files. If you specify fewer than four files, the internal default HTML pages are used.
- The four custom HTML files must be present on the flash memory of the switch. The maximum size of each HTML file is 8 KB.
- Any images on the custom pages must be on an accessible HTTP server. Configure an intercept ACL within the admission rule.
- Any external link from a custom page requires configuration of an intercept ACL within the admission rule.
- To access a valid DNS server, any name resolution required for external links or images requires configuration of an intercept ACL within the admission rule.
- If the custom web pages feature is enabled, a configured auth-proxy-banner is not used.
- If the custom web pages feature is enabled, the redirection URL for successful login feature is not available.
- To remove the specification of a custom file, use the **no** form of the command.

Because the custom login page is a public web form, consider these guidelines for the page:

- The login form must accept user entries for the username and password and must show them as **uname** and **pwd**.

- The custom login page should follow best practices for a web form, such as page timeout, hidden password, and prevention of redundant submissions.

#### Related Topics

[Customizing the Authentication Proxy Web Pages](#), on page 1847

## Redirection URL for Successful Login Guidelines

When configuring a redirection URL for successful login, consider these guidelines:

- If the custom authentication proxy web pages feature is enabled, the redirection URL feature is disabled and is not available in the CLI. You can perform redirection in the custom-login success page.
- If the redirection URL feature is enabled, a configured auth-proxy-banner is not used.
- To remove the specification of a redirection URL, use the **no** form of the command.
- If the redirection URL is required after the web-based authentication client is successfully authenticated, then the URL string must start with a valid URL (for example, http://) followed by the URL information. If only the URL is given without http://, then the redirection URL on successful authentication might cause page not found or similar errors on a web browser.

#### Related Topics

[Specifying a Redirection URL for Successful Login](#), on page 1849

## Web-based Authentication Interactions with Other Features

### Port Security

You can configure web-based authentication and port security on the same port. Web-based authentication authenticates the port, and port security manages network access for all MAC addresses, including that of the client. You can then limit the number or group of clients that can access the network through the port.

#### Related Topics

[Enabling and Configuring Port Security](#), on page 1871

### LAN Port IP

You can configure LAN port IP (LPIP) and Layer 2 web-based authentication on the same port. The host is authenticated by using web-based authentication first, followed by LPIP posture validation. The LPIP host policy overrides the web-based authentication host policy.

If the web-based authentication idle timer expires, the NAC policy is removed. The host is authenticated, and posture is validated again.

### Gateway IP

You cannot configure Gateway IP (GWIP) on a Layer 3 VLAN interface if web-based authentication is configured on any of the switch ports in the VLAN.

You can configure web-based authentication on the same Layer 3 interface as Gateway IP. The host policies for both features are applied in software. The GWIP policy overrides the web-based authentication host policy.

## ACLs

If you configure a VLAN ACL or a Cisco IOS ACL on an interface, the ACL is applied to the host traffic only after the web-based authentication host policy is applied.

For Layer 2 web-based authentication, it is more secure, though not required, to configure a port ACL (PACL) as the default access policy for ingress traffic from hosts connected to the port. After authentication, the web-based authentication host policy overrides the PACL. The Policy ACL is applied to the session even if there is no ACL configured on the port.

You cannot configure a MAC ACL and web-based authentication on the same interface.

You cannot configure web-based authentication on a port whose access VLAN is configured for VACL capture.

## Context-Based Access Control

Web-based authentication cannot be configured on a Layer 2 port if context-based access control (CBAC) is configured on the Layer 3 VLAN interface of the port VLAN.

## EtherChannel

You can configure web-based authentication on a Layer 2 EtherChannel interface. The web-based authentication configuration applies to all member channels.

# How to Configure Web-Based Authentication

## Default Web-Based Authentication Configuration

The following table shows the default web-based authentication configuration.

*Table 148: Default Web-based Authentication Configuration*

Feature	Default Setting
AAA	Disabled
RADIUS server <ul style="list-style-type: none"> <li>• IP address</li> <li>• UDP authentication port</li> <li>• Key</li> </ul>	<ul style="list-style-type: none"> <li>• None specified</li> <li>• 1645</li> <li>• None specified</li> </ul>
Default value of inactivity timeout	3600 seconds
Inactivity timeout	Enabled

## Web-Based Authentication Configuration Guidelines and Restrictions

- Web-based authentication is an ingress-only feature.
- You can configure web-based authentication only on access ports. Web-based authentication is not supported on trunk ports, EtherChannel member ports, or dynamic trunk ports.
- You cannot authenticate hosts on Layer 2 interfaces with static ARP cache assignment. These hosts are not detected by the web-based authentication feature because they do not send ARP messages.
- By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.
- You must configure at least one IP address to run the switch HTTP server. You must also configure routes to reach each host IP address. The HTTP server sends the HTTP login page to the host.
- Hosts that are more than one hop away might experience traffic disruption if an STP topology change results in the host traffic arriving on a different port. This occurs because the ARP and DHCP updates might not be sent after a Layer 2 (STP) topology change.
- Web-based authentication does not support VLAN assignment as a downloadable-host policy.
- Web-based authentication supports IPv6 in Session-aware policy mode. IPv6 Web-authentication requires at least one IPv6 address configured on the switch and IPv6 Snooping configured on the switchport.
- Web-based authentication and Network Edge Access Topology (NEAT) are mutually exclusive. You cannot use web-based authentication when NEAT is enabled on an interface, and you cannot use NEAT when web-based authentication is running on an interface.
- Web-based authentication NRH (Non-Responsive Host) is not supported for voice devices.
- Only the Password Authentication Protocol (PAP) is supported for web-based RADIUS authentication on controllers. The Challenge Handshake Authentication Protocol (CHAP) is not supported for web-based RADIUS authentication on controllers.
- Identify the following RADIUS security server settings that will be used while configuring switch-to-RADIUS-server communication:
  - Host name
  - Host IP address
  - Host name and specific UDP port numbers
  - IP address and specific UDP port numbers

The combination of the IP address and UDP port number creates a unique identifier, that enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service (for example, authentication) the second host entry that is configured functions as the failover backup to the first one. The RADIUS host entries are chosen in the order that they were configured.

- When you configure the RADIUS server parameters:
  - Specify the **key string** on a separate command line.

- For **key string**, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.
- When you specify the **key string**, use spaces within and at the end of the key. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.
- You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using with the **radius-server host** global configuration command. If you want to configure these options on a per-server basis, use the **radius-server timeout**, **radius-server transmit**, and the **radius-server key** global configuration commands. For more information, see the *Cisco IOS Security Configuration Guide*, Release 12.4 and the *Cisco IOS Security Command Reference*, Release 12.4.

---

**Note** You need to configure some settings on the RADIUS server, including: the switch IP address, the key string to be shared by both the server and the switch, and the downloadable ACL (DAACL). For more information, see the RADIUS server documentation.

---

## Configuring the Authentication Rule and Interfaces

Examples in this section are legacy-style configurations. For new-style configurations, see the *Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)*

Follow these steps to configure the authentication rule and interfaces:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip admission name** *name* **proxy http**
4. **interface** *type slot/port*
5. **ip access-group** *name*
6. **ip admission** *name*
7. **exit**
8. **ip device tracking**
9. **end**
10. **show ip admission status**
11. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
	Device> <b>enable</b>	
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip admission name name proxy http</b> <b>Example:</b> Device(config)# <b>ip admission name webauth1 proxy http</b>	Configures an authentication rule for web-based authorization.
<b>Step 4</b>	<b>interface type slot/port</b> <b>Example:</b> Device(config)# <b>interface gigabitEthernet1/0/1</b>	Enters interface configuration mode and specifies the ingress Layer 2 or Layer 3 interface to be enabled for web-based authentication. <i>type</i> can be fastethernet, gigabit ethernet, or tengigabitethernet.
<b>Step 5</b>	<b>ip access-group name</b> <b>Example:</b> Device(config-if)# <b>ip access-group webauthag</b>	Applies the default ACL.
<b>Step 6</b>	<b>ip admission name</b> <b>Example:</b> Device(config-if)# <b>ip admission webauth1</b>	Configures web-based authentication on the specified interface.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> Device(config-if)# <b>exit</b>	Returns to configuration mode.
<b>Step 8</b>	<b>ip device tracking</b> <b>Example:</b> Device(config)# <b>ip device tracking</b>	Enables the IP device tracking table.
<b>Step 9</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# <b>end</b>	
<b>Step 10</b>	<b>show ip admission status</b> <b>Example:</b> Device# <b>show ip admission status</b>	Displays the configuration.
<b>Step 11</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring AAA Authentication

If a method-list is configured under VTY lines, the corresponding method list must be added to the AAA configuration:

```
line vty 0 4
 authorization commands 15 abc
aaa authorization commands 15 abc group tacacs+
```

If a method-list is not configured under VTY lines, you must add the default method list to the AAA configuration:

```
line vty 0 4
 aaa authorization commands 15 default group tacacs+
```

Follow these steps to configure AAA authentication:

**Note** Use default list for AAA authorization, if you are planning to use features such as dACL.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **aaa new-model**
4. **aaa authentication login default group {tacacs+ | radius}**
5. **aaa authorization auth-proxy default group {tacacs+ | radius}**
6. **tacacs server *server-name***
7. **address {ipv4 | ipv6} *ip address***
8. **key *string***
9. **exit**
10. **end**
11. **show running-config**

## 12. copy running-config startup-config

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 3	<b>aaa new-model</b> <b>Example:</b> Device(config)# <b>aaa new-model</b>	Enables AAA functionality.
Step 4	<b>aaa authentication login default group {tacacs+   radius}</b> <b>Example:</b> Device(config)# <b>aaa authentication login default group tacacs+</b>	Defines the list of authentication methods at login. <b>named_authentication_list</b> refers to any name that is not greater than 31 characters. <b>AAA_group_name</b> refers to the server group name. You need to define the server-group <b>server_name</b> at the beginning itself.
Step 5	<b>aaa authorization auth-proxy default group {tacacs+   radius}</b> <b>Example:</b> Device(config)# <b>aaa authorization auth-proxy default group tacacs+</b>	Creates an authorization method list for web-based authorization.
Step 6	<b>tacacs server server-name</b> <b>Example:</b> Device(config)# <b>tacacs server yourserver</b>	Specifies an AAA server.
Step 7	<b>address {ipv4   ipv6} ip address</b> <b>Example:</b> Device(config-server-tacacs)# <b>address ipv4 10.0.1.12</b>	Configures the IP address for the TACACS server.

	Command or Action	Purpose
<b>Step 8</b>	<b>key string</b> <b>Example:</b> Device(config-server-tacacs) # <b>key cisco123</b>	Configures the authorization and encryption key used between the switch and the TACACS server.
<b>Step 9</b>	<b>exit</b> <b>Example:</b> Device(config-server-tacacs) # <b>exit</b>	Exits the TACACS server mode and enters the global configuration mode.
<b>Step 10</b>	<b>end</b> <b>Example:</b> Device(config) # <b>end</b>	Returns to privileged EXEC mode.
<b>Step 11</b>	<b>show running-config</b> <b>Example:</b> Device# <b>show running-config</b>	Verifies your entries.
<b>Step 12</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Configuring Switch-to-RADIUS-Server Communication

Follow these steps to configure the RADIUS server parameters:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip radius source-interface vlan** *vlan interface number*
4. **radius server** *server name*
5. **address** {**ipv4** | **ipv6**} *ip address*
6. **key** *string*
7. **exit**
8. **radius-server dead-criteria tries** *num-tries*
9. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip radius source-interface vlan <i>vlan interface number</i></b> <b>Example:</b> Device(config)# <b>ip radius source-interface vlan 80</b>	Specifies that the RADIUS packets have the IP address of the indicated interface.
<b>Step 4</b>	<b>radius server <i>server name</i></b> <b>Example:</b> Device(config)# <b>radius server rsim address ipv4 124.2.2.12</b>	(Optional) Specifies the IP address of the RADIUS server.
<b>Step 5</b>	<b>address {ipv4   ipv6} <i>ip address</i></b> <b>Example:</b> Device(config-radius-server)# <b>address ipv4 10.0.1.2 auth-port 1550 acct-port 1560</b>	Configures the IP address for the RADIUS server.
<b>Step 6</b>	<b>key <i>string</i></b> <b>Example:</b> Device(config-radius-server)# <b>key rad123</b>	(Optional) Specifies the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.
<b>Step 7</b>	<b>exit</b> <b>Example:</b> Device(config-radius-server)# <b>exit</b>	Exits the RADIUS server mode and enters the global configuration mode.

	Command or Action	Purpose
<b>Step 8</b>	<b>radius-server dead-criteria tries</b> <i>num-tries</i> <b>Example:</b> Device(config)# <b>radius-server dead-criteria tries</b> 30	Specifies the number of unanswered sent messages to a RADIUS server before considering the server to be inactive. The range of <i>num-tries</i> is 1 to 100.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.

## Configuring the HTTP Server

To use web-based authentication, you must enable the HTTP server within the Device. You can enable the server for either HTTP or HTTPS.

**Note** The Apple psuedo-browser will not open if you configure only the **ip http secure-server** command. You should also configure the **ip http server** command.

Follow these steps to enable the server for either HTTP or HTTPS:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip http server**
4. **ip http secure-server**
5. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.

	Command or Action	Purpose
Step 3	<b>ip http server</b> <b>Example:</b> <pre>Device(config)# ip http server</pre>	Enables the HTTP server. The web-based authentication feature uses the HTTP server to communicate with the hosts for user authentication.
Step 4	<b>ip http secure-server</b> <b>Example:</b> <pre>Device(config)# ip http secure-server</pre>	Enables HTTPS. You can configure custom authentication proxy web pages or specify a redirection URL for successful login. <b>Note</b> To ensure secure authentication when you enter the <b>ip http secure-server</b> command, the login page is always in HTTPS (secure HTTP) even if the user sends an HTTP request.
Step 5	<b>end</b> <b>Example:</b> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.

## Customizing the Authentication Proxy Web Pages

You can configure web authentication to display four substitute HTML pages to the user in place of the Device default HTML pages during web-based authentication.

For the equivalent Session Aware Networking configuration example for this feature, see the section "Configuring a Parameter Map for Web-Based Authentication" in the chapter, "Configuring Identity Control Policies." of the book, *Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)*.

Follow these steps to specify the use of your custom authentication proxy web pages:

### Before you begin

Store your custom HTML files on the Device flash memory.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip admission proxy http login page file** *device:login-filename*
4. **ip admission proxy http success page file** *device:success-filename*
5. **ip admission proxy http failure page file** *device:fail-filename*
6. **ip admission proxy http login expired page file** *device:expired-filename*
7. **end**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip admission proxy http login page file</b> <i>device:login-filename</i> <b>Example:</b> Device(config)# <b>ip admission proxy http login page</b> <b>file disk1:login.htm</b>	Specifies the location in the Device memory file system of the custom HTML file to use in place of the default login page. The <i>device:</i> is flash memory.
<b>Step 4</b>	<b>ip admission proxy http success page file</b> <i>device:success-filename</i> <b>Example:</b> Device(config)# <b>ip admission proxy http success</b> <b>page file disk1:success.htm</b>	Specifies the location of the custom HTML file to use in place of the default login success page.
<b>Step 5</b>	<b>ip admission proxy http failure page file</b> <i>device:fail-filename</i> <b>Example:</b> Device(config)# <b>ip admission proxy http fail page</b> <b>file disk1:fail.htm</b>	Specifies the location of the custom HTML file to use in place of the default login failure page.
<b>Step 6</b>	<b>ip admission proxy http login expired page file</b> <i>device:expired-filename</i> <b>Example:</b> Device(config)# <b>ip admission proxy http login</b> <b>expired page file disk1:expired.htm</b>	Specifies the location of the custom HTML file to use in place of the default login expired page.
<b>Step 7</b>	<b>end</b> <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config)# <b>end</b>	

### Related Topics

## Specifying a Redirection URL for Successful Login

Follow these steps to specify a URL to which the user is redirected after authentication, effectively replacing the internal Success HTML page:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip admission proxy http success redirect *url-string***
4. **end**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip admission proxy http success redirect <i>url-string</i></b> <b>Example:</b> Device(config)# <b>ip admission proxy http success redirect www.example.com</b>	Specifies a URL for redirection of the user in place of the default login success page.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.

**Related Topics**

[Redirection URL for Successful Login Guidelines](#), on page 1837

## Configuring the Web-Based Authentication Parameters

Follow these steps to configure the maximum number of failed login attempts before the client is placed in a watch list for a waiting period:

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip admission max-login-attempts *number***
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip admission max-login-attempts <i>number</i></b> <b>Example:</b> Device(config)# <b>ip admission max-login-attempts 10</b>	Sets the maximum number of failed login attempts. The range is 1 to 2147483647 attempts. The default is 5.
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b>	Verifies your entries.

	Command or Action	Purpose
	Device# <code>show running-config</code>	
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Configuring a Web-Based Authentication Local Banner

Follow these steps to configure a local banner on a switch that has web authentication configured.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip admission auth-proxy-banner http [banner-text | file-path]`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>ip admission auth-proxy-banner http [banner-text   file-path]</b> <b>Example:</b> Device(config)# <code>ip admission auth-proxy-banner http C My Switch C</code>	Enables the local banner. (Optional) Create a custom banner by entering <i>C banner-text C</i> (where <i>C</i> is a delimiting character), or <i>file-path</i> that indicates a file (for example, a logo or text file) that appears in the banner.

	Command or Action	Purpose
<b>Step 4</b>	<b>end</b> <b>Example:</b> Device(config)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 5</b>	<b>show running-config</b> <b>Example:</b> Device# <b>show running-config</b>	Verifies your entries.
<b>Step 6</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Removing Web-Based Authentication Cache Entries

Follow these steps to remove web-based authentication cache entries:

### SUMMARY STEPS

1. **enable**
2. **clear ip auth-proxy cache** *{\* | host ip address}*
3. **clear ip admission cache** *{\* | host ip address}*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>clear ip auth-proxy cache</b> <i>{*   host ip address}</i> <b>Example:</b> Device# <b>clear ip auth-proxy cache 192.168.4.5</b>	Delete authentication proxy entries. Use an asterisk to delete all cache entries. Enter a specific IP address to delete the entry for a single host.

	Command or Action	Purpose
Step 3	<p><b>clear ip admission cache</b> <i>{*   host ip address}</i></p> <p><b>Example:</b></p> <pre>Device# clear ip admission cache 192.168.4.5</pre>	Delete authentication proxy entries. Use an asterisk to delete all cache entries. Enter a specific IP address to delete the entry for a single host.

## Monitoring Web-Based Authentication Status

Use the commands in this topic to display the web-based authentication settings for all interfaces or for specific ports.

*Table 149: Privileged EXEC show Commands*

Command	Purpose
<b>show authentication sessions method webauth</b>	Displays the web-based authentication settings for all interfaces for fastethernet, gigabitethernet, or tengigabitethernet
<b>show authentication sessions interface</b> <i>type slot/port[details]</i>	Displays the web-based authentication settings for the specified interface for fastethernet, gigabitethernet, or tengigabitethernet.  In Session Aware Networking mode, use the <b>show access-session interface</b> command.

## Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported in the Cisco IOS Release for which this guide is written:

- Storm Control
- Protected Ports
- Port Blocking
- Port Security
- Protocol Storm Protection

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Storm Control

### Storm Control

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on one of the physical interfaces. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configurations, or users issuing a denial-of-service attack can cause a storm.

Storm control (or traffic suppression) monitors packets passing from an interface to the switching bus and determines if the packet is unicast, multicast, or broadcast. The switch counts the number of packets of a specified type received within the 1-second time interval and compares the measurement with a predefined suppression-level threshold.

### How Traffic Activity is Measured

Storm control uses one of these methods to measure traffic activity:

- Bandwidth as a percentage of the total available bandwidth of the port that can be used by the broadcast, multicast, or unicast traffic
- Traffic rate in packets per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in bits per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in packets per second and for small frames. This feature is enabled globally. The threshold for small frames is configured for each interface.

With each method, the port blocks traffic when the rising threshold is reached. The port remains blocked until the traffic rate drops below the falling threshold (if one is specified) and then resumes normal forwarding. If the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. In general, the higher the level, the less effective the protection against broadcast storms.

**Note** When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as OSPF, and regular multicast data traffic, so both types of traffic are blocked.

## Traffic Patterns

**Figure 117: Broadcast Storm Control Example**

This example shows broadcast traffic patterns on an interface over a given period of time.

Broadcast traffic being forwarded exceeded the configured threshold between time intervals T1 and T2 and between T4 and T5. When the amount of specified traffic exceeds the threshold, all traffic of that kind is dropped for the next time period. Therefore, broadcast traffic is blocked during the intervals following T2 and T5. At the next time interval (for example, T3), if broadcast traffic does not exceed the threshold, it is again forwarded.

The combination of the storm-control suppression level and the 1-second time interval controls the way the storm control algorithm works. A higher threshold allows more packets to pass through. A threshold value of 100 percent means that no limit is placed on the traffic. A value of 0.0 means that all broadcast, multicast, or unicast traffic on that port is blocked.

**Note** Because packets do not arrive at uniform intervals, the 1-second time interval during which traffic activity is measured can affect the behavior of storm control.

You use the **storm-control** interface configuration commands to set the threshold value for each traffic type.

# How to Configure Storm Control

## Configuring Storm Control and Threshold Levels

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

However, because of hardware limitations and the way in which packets of different sizes are counted, threshold percentages are approximations. Depending on the sizes of the packets making up the incoming traffic, the actual enforced threshold might differ from the configured level by several percentage points.

**Note** Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

Follow these steps to storm control and threshold levels:

### Before you begin

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **storm-control** {**broadcast** | **multicast** | **unicast**} **level** {*level* [*level-low*] | **bps** *bps* [*bps-low*] | **pps** *pps* [*pps-low*]}
5. **storm-control action** {**shutdown** | **trap**}
6. **end**
7. **show storm-control** [*interface-id*] [**broadcast** | **multicast** | **unicast**]
8. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
Step 2	<b>configure terminal</b> <b>Example:</b> <pre>Device# configure terminal</pre>	Enters the global configuration mode.
Step 3	<b>interface <i>interface-id</i></b> <b>Example:</b> <pre>Device(config)# interface gigabitethernet1/0/1</pre>	Specifies the interface to be configured, and enter interface configuration mode.
Step 4	<b>storm-control {broadcast   multicast   unicast} level {level [level-low]   bps bps [bps-low]   pps pps [pps-low]}</b> <b>Example:</b> <pre>Device(config-if)# storm-control unicast level 87 65</pre>	<p>Configures broadcast, multicast, or unicast storm control. By default, storm control is disabled.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> <li>• For <i>level</i>, specifies the rising threshold level for broadcast, multicast, or unicast traffic as a percentage (up to two decimal places) of the bandwidth. The port blocks traffic when the rising threshold is reached. The range is 0.00 to 100.00.</li> <li>• (Optional) For <i>level-low</i>, specifies the falling threshold level as a percentage (up to two decimal places) of the bandwidth. This value must be less than or equal to the rising suppression value. The port forwards traffic when traffic drops below this level. If you do not configure a falling suppression level, it is set to the rising suppression level. The range is 0.00 to 100.00.</li> </ul> <p>If you set the threshold to the maximum value (100 percent), no limit is placed on the traffic. If you set the threshold to 0.0, all broadcast, multicast, and unicast traffic on that port is blocked.</p> <ul style="list-style-type: none"> <li>• For <b>bps</b> <i>bps</i>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in bits per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</li> <li>• (Optional) For <i>bps-low</i>, specifies the falling threshold level in bits per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0.</li> <li>• For <b>pps</b> <i>pps</i>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in packets per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>(Optional) For <i>pps-low</i>, specifies the falling threshold level in packets per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is <b>0.0 to 10000000000.0</b>.</li> </ul> <p>For BPS and PPS settings, you can use metric suffixes such as k, m, and g for large number thresholds.</p>
<b>Step 5</b>	<b>storm-control action {shutdown   trap}</b> <b>Example:</b> <pre>Device(config-if)# storm-control action trap</pre>	<p>Specifies the action to be taken when a storm is detected. The default is to filter out the traffic and not to send traps.</p> <ul style="list-style-type: none"> <li>Select the <b>shutdown</b> keyword to error-disable the port during a storm.</li> <li>Select the <b>trap</b> keyword to generate an SNMP trap when a storm is detected.</li> </ul>
<b>Step 6</b>	<b>end</b> <b>Example:</b> <pre>Device(config-if)# end</pre>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show storm-control [interface-id] [broadcast   multicast   unicast]</b> <b>Example:</b> <pre>Device# show storm-control gigabitethernet1/0/1 unicast</pre>	Verifies the storm control suppression levels set on the interface for the specified traffic type. If you do not enter a traffic type, broadcast storm control settings are displayed.
<b>Step 8</b>	<b>copy running-config startup-config</b> <b>Example:</b> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Information About Protected Ports

### Protected Ports

Some applications require that no traffic be forwarded at Layer 2 between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

Protected ports have these features:

- A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control

traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.

- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack.

## Default Protected Port Configuration

The default is to have no protected ports defined.

## Protected Ports Guidelines

You can configure protected ports on a physical interface (for example, Gigabit Ethernet port 1) or an EtherChannel group (for example, port-channel 5). When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.

# How to Configure Protected Ports

## Configuring a Protected Port

### Before you begin

Protected ports are not pre-defined. This is the task to configure one.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **switchport protected**
5. **end**
6. **show interfaces *interface-id* switchport**
7. **show running-config**
8. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <code>interface gigabitethernet1/0/1</code>	Specifies the interface to be configured, and enter interface configuration mode.
<b>Step 4</b>	<b>switchport protected</b> <b>Example:</b> Device(config-if)# <code>switchport protected</code>	Configures the interface to be a protected port.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show interfaces <i>interface-id</i> switchport</b> <b>Example:</b> Device# <code>show interfaces gigabitethernet1/0/1 switchport</code>	Verifies your entries.
<b>Step 7</b>	<b>show running-config</b> <b>Example:</b> Device# <code>show running-config</code>	Verifies your entries.
<b>Step 8</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

# Monitoring Protected Ports

Table 150: Commands for Displaying Protected Port Settings

Command	Purpose
<code>show interfaces [interface-id] switchport</code>	Displays the administrative and operational status of all switching (nonrouting) ports or the specified port, including port blocking and port protection settings.

## Information About Port Blocking

### Port Blocking

By default, the switch floods packets with unknown destination MAC addresses out of all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues. To prevent unknown unicast or multicast traffic from being forwarded from one port to another, you can block a port (protected or nonprotected) from flooding unknown unicast or multicast packets to other ports.

**Note** With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

## How to Configure Port Blocking

### Blocking Flooded Traffic on an Interface

#### Before you begin

The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port-channel group.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport block multicast`
5. `switchport block unicast`
6. `end`
7. `show interfaces interface-id switchport`

8. `show running-config`
9. `copy running-config startup-config`

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <code>interface gigabitethernet1/0/1</code>	Specifies the interface to be configured, and enter interface configuration mode.
<b>Step 4</b>	<b>switchport block multicast</b> <b>Example:</b> Device(config-if)# <code>switchport block multicast</code>	Blocks unknown multicast forwarding out of the port. <b>Note</b> Only pure Layer 2 multicast traffic is blocked. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.
<b>Step 5</b>	<b>switchport block unicast</b> <b>Example:</b> Device(config-if)# <code>switchport block unicast</code>	Blocks unknown unicast forwarding out of the port.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show interfaces <i>interface-id</i> switchport</b> <b>Example:</b> Device# <code>show interfaces gigabitethernet1/0/1 switchport</code>	Verifies your entries.

	Command or Action	Purpose
Step 8	<b>show running-config</b> <b>Example:</b> Device# <code>show running-config</code>	Verifies your entries.
Step 9	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

## Monitoring Port Blocking

Table 151: Commands for Displaying Port Blocking Settings

Command	Purpose
<code>show interfaces [interface-id] switchport</code>	Displays the administrative and operational status of all switching (nonrouting) ports or the specified port, including port blocking and port protection settings.

## Prerequisites for Port Security

**Note** If you try to set the maximum value to a number less than the number of secure addresses already configured on an interface, the command is rejected.

## Restrictions for Port Security

The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

# Information About Port Security

## Port Security

You can use the port security feature to restrict input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port. When you assign secure MAC addresses to a secure port, the port does not forward packets with source addresses outside the group of defined addresses. If you limit the number of secure MAC addresses to one and assign a single secure MAC address, the workstation attached to that port is assured the full bandwidth of the port.

If a port is configured as a secure port and the maximum number of secure MAC addresses is reached, when the MAC address of a station attempting to access the port is different from any of the identified secure MAC addresses, a security violation occurs. Also, if a station with a secure MAC address configured or learned on one secure port attempts to access another secure port, a violation is flagged.

### Related Topics

[Enabling and Configuring Port Security](#), on page 1871

[Configuration Examples for Port Security](#), on page 1889

## Types of Secure MAC Addresses

The switch supports these types of secure MAC addresses:

- Static secure MAC addresses—These are manually configured by using the **switchport port-security mac-address *mac-address*** interface configuration command, stored in the address table, and added to the switch running configuration.
- Dynamic secure MAC addresses—These are dynamically configured, stored only in the address table, and removed when the switch restarts.
- Sticky secure MAC addresses—These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. If these addresses are saved in the configuration file, when the switch restarts, the interface does not need to dynamically reconfigure them.

## Sticky Secure MAC Addresses

You can configure an interface to convert the dynamic MAC addresses to sticky secure MAC addresses and to add them to the running configuration by enabling sticky learning. The interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses. All sticky secure MAC addresses are added to the running configuration.

The sticky secure MAC addresses do not automatically become part of the configuration file, which is the startup configuration used each time the switch restarts. If you save the sticky secure MAC addresses in the configuration file, when the switch restarts, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost.

If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.

## Security Violations

It is a security violation when one of these situations occurs:

- The maximum number of secure MAC addresses have been added to the address table, and a station whose MAC address is not in the address table attempts to access the interface.
- An address learned or configured on one secure interface is seen on another secure interface in the same VLAN.
- Running diagnostic tests with port security enabled.

You can configure the interface for one of three violation modes, based on the action to be taken if a violation occurs:

- **protect**—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

---

**Note** We do not recommend configuring the protect violation mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

---

- **restrict**—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. In this mode, you are notified that a security violation has occurred. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.
- **shutdown**—a port security violation causes the interface to become error-disabled and to shut down immediately, and the port LED turns off. When a secure port is in the error-disabled state, you can bring it out of this state by entering the **errdisable recovery cause psecure-violation** global configuration command, or you can manually re-enable it by entering the **shutdown** and **no shut down** interface configuration commands. This is the default mode.
- **shutdown vlan**—Use to set the security violation mode per-VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs

This table shows the violation mode and the actions taken when you configure an interface for port security.

**Table 152: Security Violation Mode Actions**

Violation Mode	Traffic is forwarded <a href="#">19</a>	Sends SNMP trap	Sends syslog message	Displays error message <a href="#">20</a>	Violation counter increments	Shuts down port
protect	No	No	No	No	No	No
restrict	No	Yes	Yes	No	Yes	No
shutdown	No	No	No	No	Yes	Yes

Violation Mode	Traffic is forwarded <a href="#">19</a>	Sends SNMP trap	Sends syslog message	Displays error message <a href="#">20</a>	Violation counter increments	Shuts down port <a href="#">21</a>
shutdown vlan	No	No	Yes	No	Yes	No

<sup>19</sup> Packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses.

<sup>20</sup> The switch returns an error message if you manually configure an address that would cause a security violation.

<sup>21</sup> Shuts down only the VLAN on which the violation occurred.

## Port Security Aging

You can use port security aging to set the aging time for all secure addresses on a port. Two types of aging are supported per port:

- Absolute—The secure addresses on the port are deleted after the specified aging time.
- Inactivity—The secure addresses on the port are deleted only if the secure addresses are inactive for the specified aging time.

### Related Topics

[Enabling and Configuring Port Security Aging](#), on page 1876

## Port Security and Switch Stacks

When a switch joins a stack, the new switch will get the configured secure addresses. All dynamic secure addresses are downloaded by the new stack member from the other stack members.

When a switch (either the active switch or a stack member) leaves the stack, the remaining stack members are notified, and the secure MAC addresses configured or learned by that switch are deleted from the secure MAC address table.

## Default Port Security Configuration

*Table 153: Default Port Security Configuration*

Feature	Default Setting
Port security	Disabled on a port.
Sticky address learning	Disabled.
Maximum number of secure MAC addresses per port	1.
Violation mode	Shutdown. The port shuts down when the maximum number of secure MAC addresses is exceeded.

Feature	Default Setting
Port security aging	Disabled. Aging time is 0. Static aging is disabled. Type is absolute.

## Port Security Configuration Guidelines

- Port security can only be configured on static access ports or trunk ports. A secure port cannot be a dynamic access port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).

---

**Note** Voice VLAN is only supported on access ports and not on trunk ports, even though the configuration is allowed.

---

- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the phone.
- When a trunk port configured with port security and assigned to an access VLAN for data traffic and to a voice VLAN for voice traffic, entering the **switchport voice** and **switchport priority extend** interface configuration commands has no effect.  
  
When a connected device uses the same MAC address to request an IP address for the access VLAN and then an IP address for the voice VLAN, only the access VLAN is assigned an IP address.
- When you enter a maximum secure address value for an interface, and the new value is greater than the previous value, the new value overwrites the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.
- The switch does not support port security aging of sticky secure MAC addresses.

This table summarizes port security compatibility with other port-based features.

**Table 154: Port Security Compatibility with Other Switch Features**

Type of Port or Feature on Port	Compatible with Port Security
DTP <a href="#">22</a> port <a href="#">23</a>	No
Trunk port	Yes
Dynamic-access port <a href="#">24</a>	No
Routed port	No

Type of Port or Feature on Port	Compatible with Port Security
SPAN source port	Yes
SPAN destination port	No
EtherChannel	Yes
Tunneling port	Yes
Protected port	Yes
IEEE 802.1x port	Yes
Voice VLAN port <sup>25</sup>	Yes
IP source guard	Yes
Dynamic Address Resolution Protocol (ARP) inspection	Yes
Flex Links	Yes

<sup>22</sup> DTP=Dynamic Trunking Protocol

<sup>23</sup> A port configured with the **switchport mode dynamic** interface configuration command.

<sup>24</sup> A VLAN Query Protocol (VQP) port configured with the **switchport access vlan dynamic** interface configuration command.

<sup>25</sup> You must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN.

## Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported in the Cisco IOS Release for which this guide is written:

- Storm Control
- Protected Ports
- Port Blocking
- Port Security
- Protocol Storm Protection

# How to Configure Port Security

## Enabling and Configuring Port Security

### Before you begin

This task restricts input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport mode** {access | trunk}
5. **switchport voice vlan** *vlan-id*
6. **switchport port-security**
7. **switchport port-security** [maximum *value* [vlan {*vlan-list* | {access | voice}}]]
8. **switchport port-security violation** {protect | restrict | shutdown | shutdown vlan}
9. **switchport port-security** [mac-address *mac-address* [vlan {*vlan-id* | {access | voice}}]]
10. **switchport port-security mac-address sticky**
11. **switchport port-security mac-address sticky** [*mac-address* | vlan {*vlan-id* | {access | voice}}]]
12. **end**
13. **show port-security**
14. **show running-config**
15. **copy running-config startup-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 3	<b>interface</b> <i>interface-id</i> <b>Example:</b>	Specifies the interface to be configured, and enter interface configuration mode.

	Command or Action	Purpose
	Device (config) # <code>interface gigabitethernet1/0/1</code>	
<b>Step 4</b>	<b>switchport mode {access   trunk}</b> <b>Example:</b> Device (config-if) # <code>switchport mode access</code>	Sets the interface switchport mode as access or trunk; an interface in the default mode (dynamic auto) cannot be configured as a secure port.
<b>Step 5</b>	<b>switchport voice vlan <i>vlan-id</i></b> <b>Example:</b> Device (config-if) # <code>switchport voice vlan 22</code>	Enables voice VLAN on a port. <i>vlan-id</i> —Specifies the VLAN to be used for voice traffic.
<b>Step 6</b>	<b>switchport port-security</b> <b>Example:</b> Device (config-if) # <code>switchport port-security</code>	Enable port security on the interface.
<b>Step 7</b>	<b>switchport port-security [maximum value [vlan {vlan-list   {access   voice}}]]</b> <b>Example:</b> Device (config-if) # <code>switchport port-security maximum 20</code>	(Optional) Sets the maximum number of secure MAC addresses for the interface. The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is set by the active Switch Database Management (SDM) template. This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces. (Optional) <b>vlan</b> —sets a per-VLAN maximum value Enter one of these options after you enter the <b>vlan</b> keyword: <ul style="list-style-type: none"> <li>• <i>vlan-list</i>—On a trunk port, you can set a per-VLAN maximum value on a range of VLANs separated by a hyphen or a series of VLANs separated by commas. For nonspecified VLANs, the per-VLAN maximum value is used.</li> <li>• <b>access</b>—On an access port, specifies the VLAN as an access VLAN.</li> <li>• <b>voice</b>—On an access port, specifies the VLAN as a voice VLAN.</li> </ul>

	Command or Action	Purpose
		<p><b>Note</b> The <b>voice</b> keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN. If an interface is configured for voice VLAN, configure a maximum of two secure MAC addresses.</p>
<p><b>Step 8</b></p>	<p><b>switchport port-security violation {protect   restrict   shutdown   shutdown vlan}</b></p> <p><b>Example:</b></p> <pre>Device(config-if) # switchport port-security violation restrict</pre>	<p>(Optional) Sets the violation mode, the action to be taken when a security violation is detected, as one of these:</p> <ul style="list-style-type: none"> <li>• <b>protect</b>—When the number of port secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.</li> </ul> <p><b>Note</b> We do not recommend configuring the protect mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.</p> <ul style="list-style-type: none"> <li>• <b>restrict</b>—When the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.</li> <li>• <b>shutdown</b>—The interface is error-disabled when a violation occurs, and the port LED turns off. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.</li> <li>• <b>shutdown vlan</b>—Use to set the security violation mode per VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs.</li> </ul>

	Command or Action	Purpose
		<p><b>Note</b> When a secure port is in the error-disabled state, you can bring it out of this state by entering the <b>errdisable recovery cause psecure-violation</b> global configuration command. You can manually re-enable it by entering the <b>shutdown</b> and <b>no shutdown</b> interface configuration commands or by using the <b>clear errdisable interface vlan</b> privileged EXEC command.</p>
<p><b>Step 9</b></p>	<p><b>switchport port-security [mac-address <i>mac-address</i> [vlan {<i>vlan-id</i>   {<b>access</b>   <b>voice</b>}}]]</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# switchport port-security mac-address 00:A0:C7:12:C9:25 vlan 3 voice</pre>	<p>(Optional) Enters a secure MAC address for the interface. You can use this command to enter the maximum number of secure MAC addresses. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned.</p> <p><b>Note</b> If you enable sticky learning after you enter this command, the secure addresses that were dynamically learned are converted to sticky secure MAC addresses and are added to the running configuration.</p> <p>(Optional) <b>vlan</b>—sets a per-VLAN maximum value.</p> <p>Enter one of these options after you enter the <b>vlan</b> keyword:</p> <ul style="list-style-type: none"> <li>• <b>vlan-id</b>—On a trunk port, you can specify the VLAN ID and the MAC address. If you do not specify a VLAN ID, the native VLAN is used.</li> <li>• <b>access</b>—On an access port, specifies the VLAN as an access VLAN.</li> <li>• <b>voice</b>—On an access port, specifies the VLAN as a voice VLAN.</li> </ul> <p><b>Note</b> The <b>voice</b> keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN. If an interface is configured for voice VLAN, configure a maximum of two secure MAC addresses.</p>
<p><b>Step 10</b></p>	<p><b>switchport port-security mac-address sticky</b></p> <p><b>Example:</b></p> <pre>Device(config-if)# switchport port-security mac-address sticky</pre>	<p>(Optional) Enables sticky learning on the interface.</p>

	Command or Action	Purpose
Step 11	<p><b>switchport port-security mac-address sticky</b>  <code>[mac-address   vlan {vlan-id   {access   voice}}]</code></p> <p><b>Example:</b></p> <pre>Device(config-if)# switchport port-security mac-address sticky 00:A0:C7:12:C9:25 vlan voice</pre>	<p>(Optional) Enters a sticky secure MAC address, repeating the command as many times as necessary. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned, are converted to sticky secure MAC addresses, and are added to the running configuration.</p> <p><b>Note</b> If you do not enable sticky learning before this command is entered, an error message appears, and you cannot enter a sticky secure MAC address.</p> <p>(Optional) <b>vlan</b>—sets a per-VLAN maximum value.</p> <p>Enter one of these options after you enter the <b>vlan</b> keyword:</p> <ul style="list-style-type: none"> <li>• <b>vlan-id</b>—On a trunk port, you can specify the VLAN ID and the MAC address. If you do not specify a VLAN ID, the native VLAN is used.</li> <li>• <b>access</b>—On an access port, specifies the VLAN as an access VLAN.</li> <li>• <b>voice</b>—On an access port, specifies the VLAN as a voice VLAN.</li> </ul> <p><b>Note</b> The <b>voice</b> keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN.</p>
Step 12	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 13	<p><b>show port-security</b></p> <p><b>Example:</b></p> <pre>Device# show port-security</pre>	Verifies your entries.
Step 14	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>	Verifies your entries.
Step 15	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p>	(Optional) Saves your entries in the configuration file.

Command or Action	Purpose
Device# <code>copy running-config startup-config</code>

## Enabling and Configuring Port Security Aging

Use this feature to remove and add devices on a secure port without manually deleting the existing secure MAC addresses and to still limit the number of secure addresses on a port. You can enable or disable the aging of secure addresses on a per-port basis.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport port-security aging {static | time time | type {absolute | inactivity}}`
5. `end`
6. `show port-security [interface interface-id] [address]`
7. `show running-config`
8. `copy running-config startup-config`

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <code>enable</code>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface <i>interface-id</i></b> <b>Example:</b> Device(config)# <code>interface gigabitethernet1/0/1</code>	Specifies the interface to be configured, and enter interface configuration mode.

	Command or Action	Purpose
Step 4	<p><b>switchport port-security aging</b> {static   time <i>time</i>   type {absolute   inactivity}}</p> <p><b>Example:</b></p> <pre>Device(config-if)# switchport port-security aging time 120</pre>	<p>Enables or disable static aging for the secure port, or set the aging time or type.</p> <p><b>Note</b> The switch does not support port security aging of sticky secure addresses.</p> <p>Enter <b>static</b> to enable aging for statically configured secure addresses on this port.</p> <p>For <i>time</i>, specifies the aging time for this port. The valid range is from 0 to 1440 minutes.</p> <p>For <b>type</b>, select one of these keywords:</p> <ul style="list-style-type: none"> <li>• <b>absolute</b>—Sets the aging type as absolute aging. All the secure addresses on this port age out exactly after the time (minutes) specified lapses and are removed from the secure address list.</li> <li>• <b>inactivity</b>—Sets the aging type as inactivity aging. The secure addresses on this port age out only if there is no data traffic from the secure source addresses for the specified time period.</li> </ul>
Step 5	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 6	<p><b>show port-security</b> [interface <i>interface-id</i>] [address]</p> <p><b>Example:</b></p> <pre>Device# show port-security interface gigabitethernet1/0/1</pre>	Verifies your entries.
Step 7	<p><b>show running-config</b></p> <p><b>Example:</b></p> <pre>Device# show running-config</pre>	Verifies your entries.
Step 8	<p><b>copy running-config startup-config</b></p> <p><b>Example:</b></p> <pre>Device# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Information About Storm Control

### Storm Control

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on one of the physical interfaces. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configurations, or users issuing a denial-of-service attack can cause a storm.

Storm control (or traffic suppression) monitors packets passing from an interface to the switching bus and determines if the packet is unicast, multicast, or broadcast. The switch counts the number of packets of a specified type received within the 1-second time interval and compares the measurement with a predefined suppression-level threshold.

### How Traffic Activity is Measured

Storm control uses one of these methods to measure traffic activity:

- Bandwidth as a percentage of the total available bandwidth of the port that can be used by the broadcast, multicast, or unicast traffic
- Traffic rate in packets per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in bits per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in packets per second and for small frames. This feature is enabled globally. The threshold for small frames is configured for each interface.

With each method, the port blocks traffic when the rising threshold is reached. The port remains blocked until the traffic rate drops below the falling threshold (if one is specified) and then resumes normal forwarding. If the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. In general, the higher the level, the less effective the protection against broadcast storms.

---

**Note**

When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BPDU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as OSPF, and regular multicast data traffic, so both types of traffic are blocked.

---

## Traffic Patterns

**Figure 118: Broadcast Storm Control Example**

This example shows broadcast traffic patterns on an interface over a given period of time.

Broadcast traffic being forwarded exceeded the configured threshold between time intervals T1 and T2 and between T4 and T5. When the amount of specified traffic exceeds the threshold, all traffic of that kind is dropped for the next time period. Therefore, broadcast traffic is blocked during the intervals following T2 and T5. At the next time interval (for example, T3), if broadcast traffic does not exceed the threshold, it is again forwarded.

The combination of the storm-control suppression level and the 1-second time interval controls the way the storm control algorithm works. A higher threshold allows more packets to pass through. A threshold value of 100 percent means that no limit is placed on the traffic. A value of 0.0 means that all broadcast, multicast, or unicast traffic on that port is blocked.

**Note** Because packets do not arrive at uniform intervals, the 1-second time interval during which traffic activity is measured can affect the behavior of storm control.

You use the **storm-control** interface configuration commands to set the threshold value for each traffic type.

## How to Configure Storm Control

### Configuring Storm Control and Threshold Levels

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

However, because of hardware limitations and the way in which packets of different sizes are counted, threshold percentages are approximations. Depending on the sizes of the packets making up the incoming traffic, the actual enforced threshold might differ from the configured level by several percentage points.

**Note** Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

Follow these steps to storm control and threshold levels:

### Before you begin

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

## SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **storm-control** {**broadcast** | **multicast** | **unicast**} **level** {*level* [*level-low*] | **bps** *bps* [*bps-low*] | **pps** *pps* [*pps-low*]}
5. **storm-control action** {**shutdown** | **trap**}
6. **end**
7. **show storm-control** [*interface-id*] [**broadcast** | **multicast** | **unicast**]
8. **copy running-config startup-config**

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Device(config)# <b>interface</b> <b>gigabitethernet1/0/1</b>	Specifies the interface to be configured, and enter interface configuration mode.
<b>Step 4</b>	<b>storm-control</b> { <b>broadcast</b>   <b>multicast</b>   <b>unicast</b> } <b>level</b> { <i>level</i> [ <i>level-low</i> ]   <b>bps</b> <i>bps</i> [ <i>bps-low</i> ]   <b>pps</b> <i>pps</i> [ <i>pps-low</i> ]} <b>Example:</b> Device(config-if)# <b>storm-control unicast level</b> 87 65	Configures broadcast, multicast, or unicast storm control. By default, storm control is disabled. The keywords have these meanings: <ul style="list-style-type: none"> <li>• For <i>level</i>, specifies the rising threshold level for broadcast, multicast, or unicast traffic as a percentage (up to two decimal places) of the bandwidth. The port blocks traffic when the rising threshold is reached. The range is 0.00 to 100.00.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• (Optional) For <i>level-low</i>, specifies the falling threshold level as a percentage (up to two decimal places) of the bandwidth. This value must be less than or equal to the rising suppression value. The port forwards traffic when traffic drops below this level. If you do not configure a falling suppression level, it is set to the rising suppression level. The range is 0.00 to 100.00.  If you set the threshold to the maximum value (100 percent), no limit is placed on the traffic. If you set the threshold to 0.0, all broadcast, multicast, and unicast traffic on that port is blocked.</li> <li>• For <b>bps</b> <i>bps</i>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in bits per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</li> <li>• (Optional) For <i>bps-low</i>, specifies the falling threshold level in bits per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0.</li> <li>• For <b>pps</b> <i>pps</i>, specifies the rising threshold level for broadcast, multicast, or unicast traffic in packets per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.</li> <li>• (Optional) For <i>pps-low</i>, specifies the falling threshold level in packets per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is <b>0.0 to</b> 10000000000.0.</li> </ul> <p>For BPS and PPS settings, you can use metric suffixes such as k, m, and g for large number thresholds.</p>
Step 5	<b>storm-control action {shutdown   trap}</b>  <b>Example:</b>  <pre>Device(config-if) # storm-control action trap</pre>	<p>Specifies the action to be taken when a storm is detected. The default is to filter out the traffic and not to send traps.</p> <ul style="list-style-type: none"> <li>• Select the <b>shutdown</b> keyword to error-disable the port during a storm.</li> <li>• Select the <b>trap</b> keyword to generate an SNMP trap when a storm is detected.</li> </ul>
Step 6	<b>end</b>  <b>Example:</b>	Returns to privileged EXEC mode.

	Command or Action	Purpose
	Device(config-if)# <b>end</b>	
<b>Step 7</b>	<b>show storm-control</b> [ <i>interface-id</i> ] [ <b>broadcast</b>   <b>multicast</b>   <b>unicast</b> ] <b>Example:</b> Device# <b>show storm-control gigabitethernet1/0/1 unicast</b>	Verifies the storm control suppression levels set on the interface for the specified traffic type. If you do not enter a traffic type, broadcast storm control settings are displayed.
<b>Step 8</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Finding Feature Information

## Information About Protected Ports

### Protected Ports

Some applications require that no traffic be forwarded at Layer 2 between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

Protected ports have these features:

- A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.
- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack.

### Default Protected Port Configuration

The default is to have no protected ports defined.

## Protected Ports Guidelines

You can configure protected ports on a physical interface (for example, Gigabit Ethernet port 1) or an EtherChannel group (for example, port-channel 5). When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.

## How to Configure Protected Ports

### Configuring a Protected Port

#### Before you begin

Protected ports are not pre-defined. This is the task to configure one.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** *interface-id*
4. **switchport protected**
5. **end**
6. **show interfaces** *interface-id* **switchport**
7. **show running-config**
8. **copy running-config startup-config**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 3	<b>interface</b> <i>interface-id</i> <b>Example:</b> Device(config)# <b>interface</b> <b>gigabitethernet1/0/1</b>	Specifies the interface to be configured, and enter interface configuration mode.
Step 4	<b>switchport protected</b> <b>Example:</b>	Configures the interface to be a protected port.

	Command or Action	Purpose
	Device(config-if) # <b>switchport protected</b>	
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config) # <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show interfaces <i>interface-id</i> switchport</b> <b>Example:</b> Device# <b>show interfaces gigabitethernet1/0/1 switchport</b>	Verifies your entries.
<b>Step 7</b>	<b>show running-config</b> <b>Example:</b> Device# <b>show running-config</b>	Verifies your entries.
<b>Step 8</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <b>copy running-config startup-config</b>	(Optional) Saves your entries in the configuration file.

## Monitoring Protected Ports

Table 155: Commands for Displaying Protected Port Settings

Command	Purpose
<b>show interfaces [<i>interface-id</i>] switchport</b>	Displays the administrative and operational status of all switching (nonrouting) ports or the specified port, including port blocking and port protection settings.

# Information About Port Blocking

## Port Blocking

By default, the switch floods packets with unknown destination MAC addresses out of all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues. To prevent unknown unicast or multicast traffic from being forwarded from one port to another, you can block a port (protected or nonprotected) from flooding unknown unicast or multicast packets to other ports.

---

**Note** With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

---

## How to Configure Port Blocking

### Blocking Flooded Traffic on an Interface

#### Before you begin

The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port-channel group.

#### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface *interface-id***
4. **switchport block multicast**
5. **switchport block unicast**
6. **end**
7. **show interfaces *interface-id* switchport**
8. **show running-config**
9. **copy running-config startup-config**

#### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 3</b>	<b>interface</b> <i>interface-id</i> <b>Example:</b> Device(config)# <code>interface gigabitethernet1/0/1</code>	Specifies the interface to be configured, and enter interface configuration mode.
<b>Step 4</b>	<b>switchport block multicast</b> <b>Example:</b> Device(config-if)# <code>switchport block multicast</code>	Blocks unknown multicast forwarding out of the port. <b>Note</b> Only pure Layer 2 multicast traffic is blocked. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.
<b>Step 5</b>	<b>switchport block unicast</b> <b>Example:</b> Device(config-if)# <code>switchport block unicast</code>	Blocks unknown unicast forwarding out of the port.
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 7</b>	<b>show interfaces</b> <i>interface-id</i> <b>switchport</b> <b>Example:</b> Device# <code>show interfaces gigabitethernet1/0/1 switchport</code>	Verifies your entries.
<b>Step 8</b>	<b>show running-config</b> <b>Example:</b> Device# <code>show running-config</code>	Verifies your entries.
<b>Step 9</b>	<b>copy running-config startup-config</b> <b>Example:</b> Device# <code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

# Monitoring Port Blocking

Table 156: Commands for Displaying Port Blocking Settings

Command	Purpose
<code>show interfaces [interface-id] switchport</code>	Displays the administrative and operational status of all switching (nonrouting) ports or the specified port, including port blocking and port protection settings.

### Technical Assistance

Description	Link
<p>The Cisco Support website provides extensive online resources, including documentation and tools for troubleshooting and resolving technical issues with Cisco products and technologies.</p> <p>To receive security and technical information about your products, you can subscribe to various services, such as the Product Alert Tool (accessed from Field Notices), the Cisco Technical Services Newsletter, and Really Simple Syndication (RSS) Feeds.</p> <p>Access to most tools on the Cisco Support website requires a Cisco.com user ID and password.</p>	<a href="http://www.cisco.com/support">http://www.cisco.com/support</a>

## Feature Information

Release	Feature Information
Cisco IOS XE 3.2SE	This feature was introduced.

## Monitoring Port Security

This table displays port security information.

**Table 157: Commands for Displaying Port Security Status and Configuration**

Command	Purpose
<b>show port-security</b> [ <i>interface interface-id</i> ]	Displays port security settings for the switch or for the specified interface, including the maximum allowed number of secure MAC addresses for each interface, the number of secure MAC addresses on the interface, the number of security violations that have occurred, and the violation mode.
<b>show port-security</b> [ <i>interface interface-id</i> ] <b>address</b>	Displays all secure MAC addresses configured on all switch interfaces or on a specified interface with aging information for each address.
<b>show port-security interface</b> <i>interface-id</i> <b>vlan</b>	Displays the number of secure MAC addresses configured per VLAN on the specified interface.

## Configuration Examples for Port Security

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 50. The violation mode is the default, no static secure MAC addresses are configured, and sticky learning is enabled.

```

Device(config)# interface gigabitethernet1/0/1
Device(config-if)# switchport mode access
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security maximum 50
Device(config-if)# switchport port-security mac-address sticky

```

This example shows how to configure a static secure MAC address on VLAN 3 on a port:

```

Device(config)# interface gigabitethernet1/0/2
Device(config-if)# switchport mode trunk
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security mac-address 0000.0200.0004 vlan 3

```

This example shows how to enable sticky port security on a port, to manually configure MAC addresses for data VLAN and voice VLAN, and to set the total maximum number of secure addresses to 20 (10 for data VLAN and 10 for voice VLAN).

```

Device(config)# interface tengigabitethernet1/0/1
Device(config-if)# switchport access vlan 21
Device(config-if)# switchport mode access
Device(config-if)# switchport voice vlan 22
Device(config-if)# switchport port-security
Device(config-if)# switchport port-security maximum 20
Device(config-if)# switchport port-security violation restrict
Device(config-if)# switchport port-security mac-address sticky
Device(config-if)# switchport port-security mac-address sticky 0000.0000.0002
Device(config-if)# switchport port-security mac-address 0000.0000.0003
Device(config-if)# switchport port-security mac-address sticky 0000.0000.0001 vlan voice
Device(config-if)# switchport port-security mac-address 0000.0000.0004 vlan voice
Device(config-if)# switchport port-security maximum 10 vlan access
Device(config-if)# switchport port-security maximum 10 vlan voice

```

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for First Hop Security in IPv6

- You have configured the necessary IPv6 enabled SDM template.
- You should be familiar with the IPv6 neighbor discovery feature.

## Restrictions for First Hop Security in IPv6

- The following restrictions apply when applying FHS policies to EtherChannel interfaces (Port Channels):
  - A physical port with an FHS policy attached cannot join an EtherChannel group.
  - An FHS policy cannot be attached to a physical port when it is a member of an EtherChannel group.
- By default, a snooping policy has a security-level of guard. When such a snooping policy is configured on an access switch, external IPv6 Router Advertisement (RA) or Dynamic Host Configuration Protocol server packets are blocked, even though the uplink port facing the router or DHCP server/relay is configured as a trusted port. To allow IPv6 RA or DHCPv6 server messages, do the following:
  - Apply an IPv6 RA-guard policy (for RA) or IPv6 DHCP-guard policy (for DHCP server messages) on the uplink port.
  - Configure a snooping policy with a lower security-level, for example glean or inspect. However, configuring a lower security level is not recommended with such a snooping policy, because benefits of First Hop security features are not effective.

## Information about First Hop Security in IPv6

First Hop Security in IPv6 (FHS IPv6) is a set of IPv6 security features, the policies of which can be attached to a physical interface, an EtherChannel interface, or a VLAN. An IPv6 software policy database service stores and accesses these policies. When a policy is configured or modified, the attributes of the policy are stored or updated in the software policy database, then applied as was specified. The following IPv6 policies are currently supported:

- IPv6 Snooping Policy—IPv6 Snooping Policy acts as a container policy that enables most of the features available with FHS in IPv6.
- IPv6 FHS Binding Table Content—A database table of IPv6 neighbors connected to the switch is created from information sources such as Neighbor Discovery (ND) protocol snooping. This database, or binding, table is used by various IPv6 guard features (such as IPv6 ND Inspection) to validate the link-layer address (LLA), the IPv4 or IPv6 address, and prefix binding of the neighbors to prevent spoofing and redirect attacks.
- IPv6 Neighbor Discovery Inspection—IPv6 ND inspection learns and secures bindings for stateless autoconfiguration addresses in Layer 2 neighbor tables. IPv6 ND inspection analyzes neighbor discovery messages in order to build a trusted binding table database and IPv6 neighbor discovery messages that do not conform are dropped. An ND message is considered trustworthy if its IPv6-to-Media Access Control (MAC) mapping is verifiable.

This feature mitigates some of the inherent vulnerabilities of the ND mechanism, such as attacks on DAD, address resolution, router discovery, and the neighbor cache.

- IPv6 Router Advertisement Guard—The IPv6 Router Advertisement (RA) guard feature enables the network administrator to block or reject unwanted or rogue RA guard messages that arrive at the network switch platform. RAs are used by routers to announce themselves on the link. The RA Guard feature analyzes the RAs and filters out bogus RAs sent by unauthorized routers. In host mode, all router

advertisement and router redirect messages are disallowed on the port. The RA guard feature compares configuration information on the Layer 2 device with the information found in the received RA frame. Once the Layer 2 device has validated the content of the RA frame and router redirect frame against the configuration, it forwards the RA to its unicast or multicast destination. If the RA frame content is not validated, the RA is dropped.

- IPv6 DHCP Guard—The IPv6 DHCP Guard feature blocks reply and advertisement messages that come from unauthorized DHCPv6 servers and relay agents. IPv6 DHCP guard can prevent forged messages from being entered in the binding table and block DHCPv6 server messages when they are received on ports that are not explicitly configured as facing a DHCPv6 server or DHCP relay. To use this feature, configure a policy and attach it to an interface or a VLAN. To debug DHCP guard packets, use the **debug ipv6 snooping dhcp-guard** privileged EXEC command.
- IPv6 Source Guard—Like IPv4 Source Guard, IPv6 Source Guard validates the source address or prefix to prevent source address spoofing.

A source guard programs the hardware to allow or deny traffic based on source or destination addresses. It deals exclusively with data packet traffic.

The IPv6 source guard feature provides the ability to store entries in the hardware TCAM table to prevent a host from sending packets with an invalid IPv6 source address.

To debug source-guard packets, use the `debug ipv6 snooping source-guard` privileged EXEC command.

---

**Note** The IPv6 source guard and prefix guard features are supported only in the ingress direction; it is not supported in the egress direction.

---

The following restrictions apply:

- An FHS policy cannot be attached to a physical port when it is a member of an EtherChannel group.
- When IPv6 source guard is enabled on a switch port, NDP or DHCP snooping must be enabled on the interface to which the switch port belongs. Otherwise, all data traffic from this port will be blocked.
- An IPv6 source guard policy cannot be attached to a VLAN. It is supported only at the interface level.
- You cannot use IPv6 Source Guard and Prefix Guard together. When you attach the policy to an interface, it should be "validate address" or "validate prefix" but not both.
- PVLAN and Source/Prefix Guard cannot be applied together.
- IPv6 Source Guard and Prefix Guard is supported on EtherChannels

For more information on IPv6 Source Guard, see the [IPv6 Source Guard](#) chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

- IPv6 Prefix Guard—The IPv6 prefix guard feature works within the IPv6 source guard feature, to enable the device to deny traffic originated from non-topologically correct addresses. IPv6 prefix guard is often used when IPv6 prefixes are delegated to devices (for example, home gateways) using DHCP prefix delegation. The feature discovers ranges of addresses assigned to the link and blocks any traffic sourced with an address outside this range.

For more information on IPv6 Prefix Guard, see the [IPv6 Prefix Guard](#) chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

- IPv6 Destination Guard—The IPv6 destination guard feature works with IPv6 neighbor discovery to ensure that the device performs address resolution only for those addresses that are known to be active on the link. It relies on the address glean functionality to populate all destinations active on the link into the binding table and then blocks resolutions before they happen when the destination is not found in the binding table.

---

**Note** IPv6 Destination Guard is recommended to apply on Layer 2 VLAN with an SVI configured

---

For more information about IPv6 Destination Guard, see the [IPv6 Destination Guard](#) chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

## How to Configure an IPv6 Snooping Policy

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Snooping Policy :

## SUMMARY STEPS

1. **configure terminal**
2. **ipv6 snooping policy** *policy-name*
3. `{[default ]|[device-role {node | switch}]|[limit address-count value]|[no]|[protocol {dhcp | ndp}]|[security-level {glean | guard | inspect}]|[tracking {disable [stale-lifetime [seconds | infinite]]|enable [reachable-lifetime [seconds | infinite]]}]|[trusted-port ]}`
4. **end**
5. **show ipv6 snooping policy** *policy-name*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 2	<b>ipv6 snooping policy</b> <i>policy-name</i> <b>Example:</b> Device(config)# <b>ipv6 snooping policy example_policy</b>	Creates a snooping policy and enters IPv6 Snooping Policy Configuration mode.
Step 3	<code>{[default ] [device-role {node   switch}] [limit address-count value] [no] [protocol {dhcp   ndp}] [security-level {glean   guard   inspect}] [tracking {disable [stale-lifetime [seconds   infinite]] enable [reachable-lifetime [seconds   infinite]]}] [trusted-port ]}</code> <b>Example:</b> Device(config-ipv6-snooping)# <b>security-level inspect</b> <b>Example:</b> Device(config-ipv6-snooping)# <b>trusted-port</b>	Enables data address glean, validates messages against various criteria, specifies the security level for messages. <ul style="list-style-type: none"> <li>• (Optional) <b>default</b>—Sets all to default options.</li> <li>• (Optional) <b>device-role {node   switch}</b>—Specifies the role of the device attached to the port. Default is <b>node</b>.</li> <li>• (Optional) <b>limit address-count value</b>—Limits the number of addresses allowed per target.</li> <li>• (Optional) <b>no</b>—Negates a command or sets it to defaults.</li> <li>• (Optional) <b>protocol {dhcp   ndp}</b>—Specifies which protocol should be redirected to the snooping feature for analysis. The default, is <b>dhcp</b> and <b>ndp</b>. To change the default, use the <b>no protocol</b> command.</li> <li>• (Optional) <b>security-level {glean guard inspect}</b>—Specifies the level of security enforced by the feature. Default is <b>guard</b>.               <ul style="list-style-type: none"> <li><b>glean</b>—Gleans addresses from messages and populates the binding table without any verification.</li> <li><b>guard</b>—Gleans addresses and inspects messages. In addition, it rejects RA and DHCP server messages. This is the default option.</li> </ul> </li> </ul>

	Command or Action	Purpose
		<p><b>inspect</b>—Gleans addresses, validates messages for consistency and conformance, and enforces address ownership.</p> <ul style="list-style-type: none"> <li>• (Optional) <b>tracking {disable   enable}</b>—Overrides the default tracking behavior and specifies a tracking option.</li> <li>• (Optional) <b>trusted-port</b>—Sets up a trusted port. It disables the guard on applicable targets. Bindings learned through a trusted port have preference over bindings learned through any other port. A trusted port is given preference in case of a collision while making an entry in the table.</li> </ul>
<b>Step 4</b>	<p><b>end</b></p> <p><b>Example:</b></p> <pre>Device(config-ipv6-snooping) # exit</pre>	Exits configuration modes to Privileged EXEC mode.
<b>Step 5</b>	<p><b>show ipv6 snooping policy <i>policy-name</i></b></p> <p><b>Example:</b></p> <pre>Device#show ipv6 snooping policy example_policy</pre>	Displays the snooping policy configuration.

### What to do next

Attach an IPv6 Snooping policy to interfaces or VLANs.

### Related Topics

[Information about First Hop Security in IPv6](#), on page 1892

## How to Attach an IPv6 Snooping Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping policy on an interface or VLAN:

### SUMMARY STEPS

1. **configure terminal**
2. **interface** Interface\_type *stack/module/port*
3. **switchport**
4. **ipv6 snooping** [**attach-policy** *policy\_name* [ **vlan** {*vlan\_id* | **add** *vlan\_ids* | **except***vlan\_ids* | **none** | **remove** *vlan\_ids*}] | **vlan** {*vlan\_id* | **add** *vlan\_ids* | **except***vlan\_ids* | **none** | **remove** *vlan\_ids* | **all**} ]
5. **do show running-config**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 2	<b>interface</b> Interface_type <i>stack/module/port</i> <b>Example:</b> Device(config)# <b>interface gigabitethernet 1/1/4</b>	Specifies an interface type and identifier; enters the interface configuration mode.
Step 3	<b>switchport</b> <b>Example:</b> Device(config-if)# <b>switchport</b>	Enters the Switchport mode.  <b>Note</b> To configure Layer 2 parameters, if the interface is in Layer 3 mode, you must enter the switchport interface configuration command without any parameters to put the interface into Layer 2 mode. This shuts down the interface and then re-enables it, which might generate messages on the device to which the interface is connected. When you put an interface that is in Layer 3 mode into Layer 2 mode, the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration. The command prompt displays as (config-if)# in Switchport configuration mode.
Step 4	<b>ipv6 snooping</b> [ <b>attach-policy</b> <i>policy_name</i> [ <b>vlan</b> { <i>vlan_id</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i> }]   <b>vlan</b> { <i>vlan_id</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b> } ] <b>Example:</b> Device(config-if)# <b>ipv6 snooping</b>  or  Device(config-if)# <b>ipv6 snooping attach-policy example_policy</b>  or  Device(config-if)# <b>ipv6 snooping vlan 111,112</b>  or  Device(config-if)# <b>ipv6 snooping attach-policy example_policy vlan 111,112</b>	Attaches a custom ipv6 snooping policy to the interface or the specified VLANs on the interface. To attach the default policy to the interface, use the <b>ipv6 snooping</b> command without the <b>attach-policy</b> keyword. To attach the default policy to VLANs on the interface, use the <b>ipv6 snooping vlan</b> command. The default policy is, security-level <b>guard</b> , device-role <b>node</b> , protocol <b>ndp</b> and <b>dhcp</b> .
Step 5	<b>do show running-config</b> <b>Example:</b>	Verifies that the policy is attached to the specified interface without exiting the interface configuration mode.

Command or Action	Purpose
Device#(config-if)# <code>do show running-config</code>	

### Related Topics

## How to Attach an IPv6 Snooping Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping policy on an EtherChannel interface or VLAN:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface range</b> <i>Interface_name</i> <b>Example:</b> Device(config)# <code>interface range Po11</code>	Specify the port-channel interface name assigned when the EtherChannel was created. Enters the interface range configuration mode.  <b>Tip</b> Enter the <b>do show interfaces summary</b> command for quick reference to interface names and types.
<b>Step 3</b>	<b>ipv6 snooping</b> [ <b>attach-policy</b> <i>policy_name</i> [ <b>vlan</b> { <i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b> } ]   <b>vlan</b> [ { <i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b> } ] ] <b>Example:</b> Device(config-if-range)# <code>ipv6 snooping attach-policy example_policy</code>  or  Device(config-if-range)# <code>ipv6 snooping attach-policy example_policy vlan 222,223,224</code>  or  Device(config-if-range)# <code>ipv6 snooping vlan 222,223,224</code>	Attaches the IPv6 Snooping policy to the interface or the specified VLANs on that interface. The default policy is attached if the <b>attach-policy</b> option is not used.

	Command or Action	Purpose
Step 4	<b>do show running-config</b> <b>interfaceportchannel_interface_name</b>  <b>Example:</b> Device# (config-if-range)# <b>do show running-config</b> <b>int poll</b>	Confirms that the policy is attached to the specified interface without exiting the configuration mode.

## How to Attach an IPv6 Snooping Policy to VLANs Globally

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping Policy to VLANs across multiple interfaces:

### SUMMARY STEPS

1. **configure terminal**
2. **vlan configuration** *vlan\_list*
3. **ipv6 snooping** [**attach-policy** *policy\_name*]
4. **do show running-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 2	<b>vlan configuration</b> <i>vlan_list</i>  <b>Example:</b> Device(config)# <b>vlan configuration</b> 333	Specifies the VLANs to which the IPv6 Snooping policy will be attached ; enters the VLAN interface configuration mode.
Step 3	<b>ipv6 snooping</b> [ <b>attach-policy</b> <i>policy_name</i> ]  <b>Example:</b> Device(config-vlan-config)# <b>ipv6 snooping</b> <b>attach-policy</b> <i>example_policy</i>	Attaches the IPv6 Snooping policy to the specified VLANs across all switch and stack interfaces. The default policy is attached if the <b>attach-policy</b> option is not used. The default policy is, security-level <b>guard</b> , device-role <b>node</b> , protocol <b>ndp</b> and <b>dhcp</b> .
Step 4	<b>do show running-config</b>  <b>Example:</b> Device# (config-if)# <b>do show running-config</b>	Verifies that the policy is attached to the specified VLANs without exiting the interface configuration mode.

### Related Topics

[Information about First Hop Security in IPv6](#), on page 1892

	Command or Action	Purpose
Step 5	<b>exit</b> <b>Example:</b> Device(config)# <b>exit</b>	Exits global configuration mode, and places the router in privileged EXEC mode.
Step 6	<b>show ipv6 neighbor binding</b> <b>Example:</b> Device# <b>show ipv6 neighbor binding</b>	Displays contents of a binding table.

## How to Configure an IPv6 Neighbor Discovery Inspection Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 ND Inspection Policy:

### SUMMARY STEPS

1. **configure terminal**
2. **[no]ipv6 nd inspection policy *policy-name***
3. **device-role {host | monitor | router | switch}**
4. **drop-unsecure**
5. **limit address-count *value***
6. **sec-level minimum *value***
7. **tracking {enable [reachable-lifetime {*value* | infinite}] | disable [stale-lifetime {*value* | infinite}]}**
8. **trusted-port**
9. **validate source-mac**
10. **no {device-role | drop-unsecure | limit address-count | sec-level minimum | tracking | trusted-port | validate source-mac}**
11. **default {device-role | drop-unsecure | limit address-count | sec-level minimum | tracking | trusted-port | validate source-mac}**
12. **do show ipv6 nd inspection policy *policy\_name***

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 2	<b>[no]ipv6 nd inspection policy <i>policy-name</i></b> <b>Example:</b> Device(config)# <b>ipv6 nd inspection policy example_policy</b>	Specifies the ND inspection policy name and enters ND Inspection Policy configuration mode.
Step 3	<b>device-role {host   monitor   router   switch}</b> <b>Example:</b>	Specifies the role of the device attached to the port. The default is <b>host</b> .

	Command or Action	Purpose
	Device(config-nd-inspection)# <b>device-role switch</b>	
<b>Step 4</b>	<b>drop-unsecure</b> <b>Example:</b> Device(config-nd-inspection)# <b>drop-unsecure</b>	Drops messages with no or invalid options or an invalid signature.
<b>Step 5</b>	<b>limit address-count value</b> <b>Example:</b> Device(config-nd-inspection)# <b>limit address-count 1000</b>	Enter 1–10,000.
<b>Step 6</b>	<b>sec-level minimum value</b> <b>Example:</b> Device(config-nd-inspection)# <b>limit address-count 1000</b>	Specifies the minimum security level parameter value when Cryptographically Generated Address (CGA) options are used.
<b>Step 7</b>	<b>tracking {enable [reachable-lifetime {value   infinite}]   disable [stale-lifetime {value   infinite}]}</b> <b>Example:</b> Device(config-nd-inspection)# <b>tracking disable stale-lifetime infinite</b>	Overrides the default tracking policy on a port.
<b>Step 8</b>	<b>trusted-port</b> <b>Example:</b> Device(config-nd-inspection)# <b>trusted-port</b>	Configures a port to become a trusted port.
<b>Step 9</b>	<b>validate source-mac</b> <b>Example:</b> Device(config-nd-inspection)# <b>validate source-mac</b>	Checks the source media access control (MAC) address against the link-layer address.
<b>Step 10</b>	<b>no {device-role   drop-unsecure   limit address-count   sec-level minimum   tracking   trusted-port   validate source-mac}</b> <b>Example:</b> Device(config-nd-inspection)# <b>no validate source-mac</b>	Remove the current configuration of a parameter with the <b>no</b> form of the command.
<b>Step 11</b>	<b>default {device-role   drop-unsecure   limit address-count   sec-level minimum   tracking   trusted-port   validate source-mac}</b> <b>Example:</b> Device(config-nd-inspection)# <b>default limit address-count</b>	Restores configuration to the default values.
<b>Step 12</b>	<b>do show ipv6 nd inspection policy policy_name</b> <b>Example:</b>	Verifies the ND Inspection Configuration without exiting ND inspection configuration mode.

	Command or Action	Purpose
	Device(config-nd-inspection)# <b>do show ipv6 nd inspection policy example_policy</b>

## How to Attach an IPv6 Neighbor Discovery Inspection Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 ND Inspection policy to an interface or VLANs on an interface :

### SUMMARY STEPS

1. **configure terminal**
2. **interface** Interface\_type *stack/module/port*
3. **ipv6 nd inspection** [**attach-policy** *policy\_name* [ **vlan** {*vlan\_ids* | **add** *vlan\_ids* | **except** *vlan\_ids* | **none** | **remove** *vlan\_ids* | **all**} ] | **vlan** [ {*vlan\_ids* | **add** *vlan\_ids* | **except** *vlan\_ids* | **none** | **remove** *vlan\_ids* | **all**} ] ]
4. **do show running-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface</b> Interface_type <i>stack/module/port</i>  <b>Example:</b> Device(config)# <b>interface gigabitethernet 1/1/4</b>	Specifies an interface type and identifier; enters the interface configuration mode.
<b>Step 3</b>	<b>ipv6 nd inspection</b> [ <b>attach-policy</b> <i>policy_name</i> [ <b>vlan</b> { <i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b> } ]   <b>vlan</b> [ { <i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b> } ] ]  <b>Example:</b> Device(config-if)# <b>ipv6 nd inspection attach-policy example_policy</b>  or Device(config-if)# <b>ipv6 nd inspection attach-policy example_policy vlan 222,223,224</b>  or Device(config-if)# <b>ipv6 nd inspection vlan 222,223,224</b>	Attaches the Neighbor Discovery Inspection policy to the interface or the specified VLANs on that interface. The default policy is attached if the <b>attach-policy</b> option is not used.

	Command or Action	Purpose
<b>Step 4</b>	<b>do show running-config</b> <b>Example:</b> Device#(config-if)# <b>do show running-config</b>	Verifies that the policy is attached to the specified interface without exiting the interface configuration mode.

## How to Attach an IPv6 Neighbor Discovery Inspection Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Neighbor Discovery Inspection policy on an EtherChannel interface or VLAN:

#### SUMMARY STEPS

1. **configure terminal**
2. **interface range** *Interface\_name*
3. **ipv6 nd inspection** [**attach-policy** *policy\_name* [ **vlan** {*vlan\_ids* | **add** *vlan\_ids* | **except** *vlan\_ids* | **none** | **remove** *vlan\_ids* | **all**} ] | **vlan** [ {*vlan\_ids* | **add** *vlan\_ids* | **except** *vlan\_ids* | **none** | **remove** *vlan\_ids* | **all**} ] ]
4. **do show running-config interfaceportchannel** *interface\_name*

#### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface range</b> <i>Interface_name</i> <b>Example:</b> Device(config)# <b>interface Po11</b>	Specify the port-channel interface name assigned when the EtherChannel was created. Enters the interface range configuration mode.  <b>Tip</b> Enter the <b>do show interfaces summary</b> command for quick reference to interface names and types.
<b>Step 3</b>	<b>ipv6 nd inspection</b> [ <b>attach-policy</b> <i>policy_name</i> [ <b>vlan</b> { <i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b> } ]   <b>vlan</b> [ { <i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b> } ] ] <b>Example:</b>	Attaches the ND Inspection policy to the interface or the specified VLANs on that interface. The default policy is attached if the <b>attach-policy</b> option is not used.

	Command or Action	Purpose
	<pre>Device(config-if-range)# ipv6 nd inspection attach-policy example_policy  or  Device(config-if-range)# ipv6 nd inspection attach-policy example_policy vlan 222,223,224  or  Device(config-if-range)#ipv6 nd inspection vlan 222, 223,224</pre>	
<b>Step 4</b>	<p><b>do show running-config</b> <b>interface</b><i>portchannel_interface_name</i></p> <p><b>Example:</b></p> <pre>Device#(config-if-range)# do show running-config int poll</pre>	Confirms that the policy is attached to the specified interface without exiting the configuration mode.

## How to Attach an IPv6 Neighbor Discovery Inspection Policy to VLANs Globally

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 ND Inspection policy to VLANs across multiple interfaces:

### SUMMARY STEPS

1. **configure terminal**
2. **vlan configuration** *vlan\_list*
3. **ipv6 nd inspection** [**attach-policy** *policy\_name*]
4. **do show running-config**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<p><b>vlan configuration</b> <i>vlan_list</i></p> <p><b>Example:</b></p> <pre>Device(config)# vlan configuration 334</pre>	Specifies the VLANs to which the IPv6 Snooping policy will be attached ; enters the VLAN interface configuration mode.
<b>Step 3</b>	<p><b>ipv6 nd inspection</b> [<b>attach-policy</b> <i>policy_name</i>]</p> <p><b>Example:</b></p> <pre>Device(config-vlan-config)#ipv6 nd inspection attach-policy example_policy</pre>	Attaches the IPv6 Neighbor Discovery policy to the specified VLANs across all switch and stack interfaces. The default policy is attached if the <b>attach-policy</b> option is not used.

	Command or Action	Purpose
		The default policy is, device-role <b>host</b> , no drop-unsecure, limit address-count disabled, sec-level minimum is disabled, tracking is disabled, no trusted-port, no validate source-mac.
<b>Step 4</b>	<b>do show running-config</b> <b>Example:</b> Device# (config-if) # <b>do show running-config</b>	Confirms that the policy is attached to the specified VLANs without exiting the configuration mode.

# How to Configure an IPv6 Router Advertisement Guard Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 Router Advertisement policy :

## SUMMARY STEPS

1. **configure terminal**
2. **[no]ipv6 nd rguard policy *policy-name***
3. **[no]device-role {host | monitor | router | switch}**
4. **[no]hop-limit {maximum | minimum} *value***
5. **[no]managed-config-flag {off | on}**
6. **[no]match {ipv6 access-list *list* | ra prefix-list *list*}**
7. **[no]other-config-flag {on | off}**
8. **[no]router-preference maximum {high | medium | low}**
9. **[no]trusted-port**
10. **default {device-role | hop-limit {maximum | minimum} | managed-config-flag | match {ipv6 access-list | ra prefix-list } | other-config-flag | router-preference maximum| trusted-port}**
11. **do show ipv6 nd rguard policy *policy\_name***

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>[no]ipv6 nd rguard policy <i>policy-name</i></b> <b>Example:</b> Device (config) # <b>ipv6 nd rguard policy example_policy</b>	Specifies the RA Guard policy name and enters RA Guard Policy configuration mode.
<b>Step 3</b>	<b>[no]device-role {host   monitor   router   switch}</b> <b>Example:</b>	Specifies the role of the device attached to the port. The default is <b>host</b> .

	Command or Action	Purpose
	Device(config-nd-raguard)# <b>device-role switch</b>	<p><b>Note</b> For a network with both host-facing ports and router-facing ports, along with a RA guard policy configured with <b>device-role host</b> on host-facing ports or vlan, it is mandatory to configure a RA guard policy with <b>device-role router</b> on router-facing ports to allow the RA Guard feature to work properly.</p>
<b>Step 4</b>	<p><b>[no]hop-limit {maximum   minimum} value</b></p> <p><b>Example:</b></p> <pre>Device(config-nd-raguard)# hop-limit maximum 33</pre>	<p>(1–255) Range for Maximum and Minimum Hop Limit values.</p> <p>Enables filtering of Router Advertisement messages by the Hop Limit value. A rogue RA message may have a low Hop Limit value (equivalent to the IPv4 Time to Live) that when accepted by the host, prevents the host from generating traffic to destinations beyond the rogue RA message generator. An RA message with an unspecified Hop Limit value is blocked.</p> <p>If not configured, this filter is disabled. Configure <b>minimum</b> to block RA messages with Hop Limit values lower than the value you specify. Configure <b>maximum</b> to block RA messages with Hop Limit values greater than the value you specify.</p>
<b>Step 5</b>	<p><b>[no]managed-config-flag {off   on}</b></p> <p><b>Example:</b></p> <pre>Device(config-nd-raguard)# managed-config-flag on</pre>	<p>Enables filtering of Router Advertisement messages by the Managed Address Configuration, or "M" flag field. A rogue RA message with an M field of 1 can cause a host to use a rogue DHCPv6 server. If not configured, this filter is disabled.</p> <p><b>On</b>—Accepts and forwards RA messages with an M value of 1, blocks those with 0.</p> <p><b>Off</b>—Accepts and forwards RA messages with an M value of 0, blocks those with 1.</p>
<b>Step 6</b>	<p><b>[no]match {ipv6 access-list list   ra prefix-list list}</b></p> <p><b>Example:</b></p> <pre>Device(config-nd-raguard)# match ipv6 access-list example_list</pre>	Matches a specified prefix list or access list.
<b>Step 7</b>	<p><b>[no]other-config-flag {on   off}</b></p> <p><b>Example:</b></p> <pre>Device(config-nd-raguard)# other-config-flag on</pre>	<p>Enables filtering of Router Advertisement messages by the Other Configuration, or "O" flag field. A rogue RA message with an O field of 1 can cause a host to use a rogue DHCPv6 server. If not configured, this filter is disabled.</p> <p><b>On</b>—Accepts and forwards RA messages with an O value of 1, blocks those with 0.</p>

	Command or Action	Purpose
		<b>Off</b> —Accepts and forwards RA messages with an O value of 0, blocks those with 1.
<b>Step 8</b>	<b>[no]router-preference maximum {high   medium   low}</b> <b>Example:</b> Device (config-nd-raguard) # <b>router-preference maximum high</b>	Enables filtering of Router Advertisement messages by the Router Preference flag. If not configured, this filter is disabled. <ul style="list-style-type: none"> <li>• <b>high</b>—Accepts RA messages with the Router Preference set to high, medium, or low.</li> <li>• <b>medium</b>—Blocks RA messages with the Router Preference set to high.</li> <li>• <b>low</b>—Blocks RA messages with the Router Preference set to medium and high.</li> </ul>
<b>Step 9</b>	<b>[no]trusted-port</b> <b>Example:</b> Device (config-nd-raguard) # <b>trusted-port</b>	When configured as a trusted port, all attached devices are trusted, and no further message verification is performed.
<b>Step 10</b>	<b>default {device-role   hop-limit {maximum   minimum}   managed-config-flag   match {ipv6 access-list   ra prefix-list }   other-config-flag   router-preference maximum   trusted-port}</b> <b>Example:</b> Device (config-nd-raguard) # <b>default hop-limit</b>	Restores a command to its default value.
<b>Step 11</b>	<b>do show ipv6 nd raguard policy <i>policy_name</i></b> <b>Example:</b> Device (config-nd-raguard) # <b>do show ipv6 nd raguard policy example_policy</b>	(Optional)—Displays the ND Guard Policy configuration without exiting the RA Guard policy configuration mode.

## How to Attach an IPv6 Router Advertisement Guard Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Router Advertisement policy to an interface or to VLANs on the interface :

### SUMMARY STEPS

1. **configure terminal**
2. **interface** Interface\_type *stack/module/port*
3. **ipv6 nd raguard** [**attach-policy** *policy\_name* [ **vlan** {*vlan\_ids* | **add** *vlan\_ids* | **except** *vlan\_ids* | **none** | **remove** *vlan\_ids* | **all**} ] | **vlan** [ {*vlan\_ids* | **add** *vlan\_ids* | **except** *vlan\_ids* | **none** | **remove** *vlan\_ids* | **all**} ] ]
4. **do show running-config**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 2	<b>interface</b> <i>Interface_type stack/module/port</i> <b>Example:</b> Device(config)# <b>interface gigabitethernet 1/1/4</b>	Specifies an interface type and identifier; enters the interface configuration mode.
Step 3	<b>ipv6 nd raguard</b> [ <b>attach-policy</b> <i>policy_name</i> [ <b>vlan</b> { <i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b> } ]   <b>vlan</b> [ { <i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b> } ] ] <b>Example:</b> Device(config-if)# <b>ipv6 nd raguard attach-policy example_policy</b>  or  Device(config-if)# <b>ipv6 nd raguard attach-policy example_policy vlan 222,223,224</b>  or  Device(config-if)# <b>ipv6 nd raguard vlan 222,223,224</b>	Attaches the Neighbor Discovery Inspection policy to the interface or the specified VLANs on that interface. The default policy is attached if the <b>attach-policy</b> option is not used.
Step 4	<b>do show running-config</b> <b>Example:</b> Device#(config-if)# <b>do show running-config</b>	Confirms that the policy is attached to the specified interface without exiting the configuration mode.

## How to Attach an IPv6 Router Advertisement Guard Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Router Advertisement Guard Policy on an EtherChannel interface or VLAN:

## SUMMARY STEPS

1. **configure terminal**
2. **interface range** *Interface\_name*

3. `ipv6 nd rguard [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ] | vlan [ {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ]`
4. `do show running-config interfaceportchannel interface_name`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface range <i>Interface_name</i></b> <b>Example:</b> Device(config)# <code>interface Po11</code>	Specify the port-channel interface name assigned when the EtherChannel was created. Enters the interface range configuration mode.  <b>Tip</b> Enter the <b>do show interfaces summary</b> command for quick reference to interface names and types.
<b>Step 3</b>	<b>ipv6 nd rguard [attach-policy <i>policy_name</i> [ vlan {<i>vlan_ids</i>   add <i>vlan_ids</i>   except <i>vlan_ids</i>   none   remove <i>vlan_ids</i>   all} ]   vlan [ {<i>vlan_ids</i>   add <i>vlan_ids</i>   except <i>vlan_ids</i>   none   remove <i>vlan_ids</i>   all} ]</b> <b>Example:</b> Device(config-if-range)# <code>ipv6 nd rguard attach-policy example_policy</code>  or Device(config-if-range)# <code>ipv6 nd rguard attach-policy example_policy vlan 222,223,224</code>  or Device(config-if-range)# <code>ipv6 nd rguard vlan 222,223,224</code>	Attaches the RA Guard policy to the interface or the specified VLANs on that interface. The default policy is attached if the <b>attach-policy</b> option is not used.
<b>Step 4</b>	<b>do show running-config interfaceportchannel <i>interface_name</i></b> <b>Example:</b> Device#(config-if-range)# <code>do show running-config int po11</code>	Confirms that the policy is attached to the specified interface without exiting the configuration mode.

## How to Attach an IPv6 Router Advertisement Guard Policy to VLANs Globally

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Router Advertisement policy to VLANs regardless of interface:

### SUMMARY STEPS

1. **configure terminal**
2. **vlan configuration** *vlan\_list*
3. **ipv6 dhcp guard** [**attach-policy** *policy\_name*]
4. **do show running-config**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>vlan configuration</b> <i>vlan_list</i> <b>Example:</b> Device(config)# <b>vlan configuration</b> 335	Specifies the VLANs to which the IPv6 RA Guard policy will be attached ; enters the VLAN interface configuration mode.
Step 3	<b>ipv6 dhcp guard</b> [ <b>attach-policy</b> <i>policy_name</i> ] <b>Example:</b> Device(config-vlan-config)# <b>ipv6 nd raguard</b> <b>attach-policy</b> <b>example_policy</b>	Attaches the IPv6 RA Guard policy to the specified VLANs across all switch and stack interfaces. The default policy is attached if the <b>attach-policy</b> option is not used.
Step 4	<b>do show running-config</b> <b>Example:</b> Device#(config-if)# <b>do show running-config</b>	Confirms that the policy is attached to the specified VLANs without exiting the configuration mode.

## How to Configure an IPv6 DHCP Guard Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 DHCP (DHCPv6) Guard policy:

### SUMMARY STEPS

1. **configure terminal**
2. **[no]ipv6 dhcp guard policy** *policy-name*
3. **[no]device-role** {**client** | **server**}
4. **[no] match server access-list** *ipv6-access-list-name*

5. `[no] match reply prefix-list ipv6-prefix-list-name`
6. `[no] preference { max limit | min limit }`
7. `[no] trusted-port`
8. `default {device-role | trusted-port}`
9. `do show ipv6 dhcp guard policy policy_name`

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# <code>configure terminal</code>	Enters the global configuration mode.
<b>Step 2</b>	<code>[no]ipv6 dhcp guard policy policy-name</code> <b>Example:</b> Device(config)# <code>ipv6 dhcp guard policy example_policy</code>	Specifies the DHCPv6 Guard policy name and enters DHCPv6 Guard Policy configuration mode.
<b>Step 3</b>	<code>[no]device-role {client   server}</code> <b>Example:</b> Device(config-dhcp-guard)# <code>device-role server</code>	(Optional) Filters out DHCPv6 replies and DHCPv6 advertisements on the port that are not from a device of the specified role. Default is <b>client</b> . <ul style="list-style-type: none"> <li>• <b>client</b>—Default value, specifies that the attached device is a client. Server messages are dropped on this port.</li> <li>• <b>server</b>—Specifies that the attached device is a DHCPv6 server. Server messages are allowed on this port.</li> </ul>
<b>Step 4</b>	<code>[no] match server access-list ipv6-access-list-name</code> <b>Example:</b> <pre>;;Assume a preconfigured IPv6 Access List as follows: Device(config)# ipv6 access-list my_acls Device(config-ipv6-acl)# permit host FE80::A8BB:CCFF:FE01:F700 any  ;;configure DHCPv6 Guard to match approved access list. Device(config-dhcp-guard)# match server access-list my_acls</pre>	(Optional). Enables verification that the advertised DHCPv6 server or relay address is from an authorized server access list (The destination address in the access list is 'any'). If not configured, this check will be bypassed. An empty access list is treated as a permit all.
<b>Step 5</b>	<code>[no] match reply prefix-list ipv6-prefix-list-name</code> <b>Example:</b> <pre>;;Assume a preconfigured IPv6 prefix list as follows: Device(config)# ipv6 prefix-list my_prefix permit 2001:0DB8::/64 le 128</pre>	(Optional) Enables verification of the advertised prefixes in DHCPv6 reply messages from the configured authorized prefix list. If not configured, this check will be bypassed. An empty prefix list is treated as a permit.

	Command or Action	Purpose
	;; Configure DHCPv6 Guard to match prefix Device(config-dhcp-guard)# <b>match reply prefix-list my_prefix</b>	
<b>Step 6</b>	<b>[no]preference{ max limit   min limit }</b>  <b>Example:</b> Device(config-dhcp-guard)# <b>preference max 250</b> Device(config-dhcp-guard)# <b>preference min 150</b>	Configure <b>max</b> and <b>min</b> when <b>device-role</b> is <b>server</b> to filter DHCPv6 server advertisements by the server preference value. The defaults permit all advertisements.  <b>max limit</b> —(0 to 255) (Optional) Enables verification that the advertised preference (in preference option) is less than the specified limit. Default is 255. If not specified, this check will be bypassed.  <b>min limit</b> —(0 to 255) (Optional) Enables verification that the advertised preference (in preference option) is greater than the specified limit. Default is 0. If not specified, this check will be bypassed.
<b>Step 7</b>	<b>[no] trusted-port</b>  <b>Example:</b> Device(config-dhcp-guard)# <b>trusted-port</b>	(Optional) <b>trusted-port</b> —Sets the port to a trusted mode. No further policing takes place on the port.  <b>Note</b> If you configure a trusted port then the device-role option is not available.
<b>Step 8</b>	<b>default {device-role   trusted-port}</b>  <b>Example:</b> Device(config-dhcp-guard)# <b>default device-role</b>	(Optional) <b>default</b> —Sets a command to its defaults.
<b>Step 9</b>	<b>do show ipv6 dhcp guard policy policy_name</b>  <b>Example:</b> Device(config-dhcp-guard)# <b>do show ipv6 dhcp guard policy example_policy</b>	(Optional) Displays the configuration of the IPv6 DHCP guard policy without leaving the configuration submode. Omitting the <i>policy_name</i> variable displays all DHCPv6 policies.

### Example of DHCPv6 Guard Configuration

```
enable
configure terminal
ipv6 access-list acl1
 permit host FE80::A8BB:CCFF:FE01:F700 any
ipv6 prefix-list abc permit 2001:0DB8::/64 le 128
ipv6 dhcp guard policy poll
 device-role server
 match server access-list acl1
 match reply prefix-list abc
 preference min 0
 preference max 255
 trusted-port
interface GigabitEthernet 0/2/0
 switchport
 ipv6 dhcp guard attach-policy poll vlan add 1
 vlan 1
 ipv6 dhcp guard attach-policy poll
show ipv6 dhcp guard policy poll
```

## How to Attach an IPv6 DHCP Guard Policy to an Interface or a VLAN on an Interface

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Binding Table Content :

**SUMMARY STEPS**

1. **configure terminal**
2. **interface** *Interface\_type stack/module/port*
3. **ipv6 dhcp guard** [**attach-policy** *policy\_name* [ **vlan** {*vlan\_ids* | **add** *vlan\_ids* | **except** *vlan\_ids* | **none** | **remove** *vlan\_ids* | **all**} ] | **vlan** [ {*vlan\_ids* | **add** *vlan\_ids* | **except** *vlan\_ids* | **none** | **remove** *vlan\_ids* | **all**} ] ]
4. **do show running-config interface** *Interface\_type stack/module/port*

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 2</b>	<b>interface</b> <i>Interface_type stack/module/port</i>  <b>Example:</b> Device(config)# <b>interface gigabitethernet 1/1/4</b>	Specifies an interface type and identifier; enters the interface configuration mode.
<b>Step 3</b>	<b>ipv6 dhcp guard</b> [ <b>attach-policy</b> <i>policy_name</i> [ <b>vlan</b> { <i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b> } ]   <b>vlan</b> [ { <i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b> } ] ]  <b>Example:</b> Device(config-if)# <b>ipv6 dhcp guard attach-policy example_policy</b>  or Device(config-if)# <b>ipv6 dhcp guard attach-policy example_policy vlan 222,223,224</b>  or Device(config-if)# <b>ipv6 dhcp guard vlan 222,223,224</b>	Attaches the DHCP Guard policy to the interface or the specified VLANs on that interface. The default policy is attached if the <b>attach-policy</b> option is not used.

	Command or Action	Purpose
Step 4	<p><b>do show running-config interface</b> <i>Interface_type</i> <i>stack/module/port</i></p> <p><b>Example:</b></p> <pre>Device# (config-if)# do show running-config gig 1/1/4</pre>	Confirms that the policy is attached to the specified interface without exiting the configuration mode.

## How to Attach an IPv6 DHCP Guard Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 DHCP Guard policy on an EtherChannel interface or VLAN:

### SUMMARY STEPS

1. **configure terminal**
2. **interface range** *Interface\_name*
3. **ipv6 dhcp guard** [**attach-policy** *policy\_name* [ **vlan** {*vlan\_ids* | **add** *vlan\_ids* | **except** *vlan\_ids* | **none** | **remove** *vlan\_ids* | **all**} ] | **vlan** [ {*vlan\_ids* | **add** *vlan\_ids* | **except** *vlan\_ids* | **none** | **remove** *vlan\_ids* | **all**} ] ]
4. **do show running-config interface** *portchannel\_interface\_name*

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters the global configuration mode.
Step 2	<p><b>interface range</b> <i>Interface_name</i></p> <p><b>Example:</b></p> <pre>Device (config)# interface Po11</pre>	Specify the port-channel interface name assigned when the EtherChannel was created. Enters the interface range configuration mode.  <b>Tip</b> Enter the <b>do show interfaces summary</b> command for quick reference to interface names and types.
Step 3	<p><b>ipv6 dhcp guard</b> [<b>attach-policy</b> <i>policy_name</i> [ <b>vlan</b> {<i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b>} ]   <b>vlan</b> [ {<i>vlan_ids</i>   <b>add</b> <i>vlan_ids</i>   <b>except</b> <i>vlan_ids</i>   <b>none</b>   <b>remove</b> <i>vlan_ids</i>   <b>all</b>} ] ]</p> <p><b>Example:</b></p> <pre>Device (config-if-range)# ipv6 dhcp guard attach-policy example_policy</pre> <p>or</p>	Attaches the DHCP Guard policy to the interface or the specified VLANs on that interface. The default policy is attached if the <b>attach-policy</b> option is not used.

	Command or Action	Purpose
	<pre>Device(config-if-range)# ipv6 dhcp guard attach-policy example_policy vlan 222,223,224  or  Device(config-if-range)#ipv6 dhcp guard vlan 222, 223,224</pre>	
<b>Step 4</b>	<p><b>do show running-config</b>  <b>interfaceportchannel</b> <i>interface_name</i></p> <p><b>Example:</b></p> <pre>Device#(config-if-range)# do show running-config int po11</pre>	Confirms that the policy is attached to the specified interface without exiting the configuration mode.

## How to Attach an IPv6 DHCP Guard Policy to VLANs Globally

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 DHCP Guard policy to VLANs across multiple interfaces:

**SUMMARY STEPS**

1. **configure terminal**
2. **vlan configuration** *vlan\_list*
3. **ipv6 dhcp guard** [**attach-policy** *policy\_name*]
4. **do show running-config**

**DETAILED STEPS**

	Command or Action	Purpose
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>Device# configure terminal</pre>	Enters the global configuration mode.
<b>Step 2</b>	<p><b>vlan configuration</b> <i>vlan_list</i></p> <p><b>Example:</b></p> <pre>Device(config)# vlan configuration 334</pre>	Specifies the VLANs to which the IPv6 Snooping policy will be attached ; enters the VLAN interface configuration mode.
<b>Step 3</b>	<p><b>ipv6 dhcp guard</b> [<b>attach-policy</b> <i>policy_name</i>]</p> <p><b>Example:</b></p> <pre>Device(config-vlan-config)#ipv6 dhcp guard attach-policy example_policy</pre>	Attaches the IPv6 Neighbor Discovery policy to the specified VLANs across all switch and stack interfaces. The default policy is attached if the <b>attach-policy</b> option is not used. The default policy is, device-role <b>client</b> , <b>no</b> trusted-port.

	Command or Action	Purpose
Step 4	<b>do show running-config</b> <b>Example:</b> Device#(config-if)# <b>do show running-config</b>	Confirms that the policy is attached to the specified VLANs without exiting the configuration mode.

## How to Configure IPv6 Source Guard

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **[no] ipv6 source-guard policy *policy\_name***
4. **[deny global-autoconf] [permit link-local] [default{. . .}] [exit] [no{. . .}]**
5. **end**
6. **show ipv6 source-guard policy *policy\_name***

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
Step 3	<b>[no] ipv6 source-guard policy <i>policy_name</i></b> <b>Example:</b> Device(config)# <b>ipv6 source-guard policy example_policy</b>	Specifies the IPv6 Source Guard policy name and enters IPv6 Source Guard policy configuration mode.
Step 4	<b>[deny global-autoconf] [permit link-local] [default{. . .}] [exit] [no{. . .}]</b> <b>Example:</b> Device(config-sisf-sourceguard)# <b>deny global-autoconf</b>	(Optional) Defines the IPv6 Source Guard policy. <ul style="list-style-type: none"> <li>• <b>deny global-autoconf</b>—Denies data traffic from auto-configured global addresses. This is useful when all global addresses on a link are DHCP-assigned and the administrator wants to block hosts with self-configured addresses to send traffic.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>• <b>permit link-local</b>—Allows all data traffic that is sourced by a link-local address.</li> </ul> <p><b>Note</b> Trusted option under source guard policy is not supported.</p>
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device(config-sisf-sourceguard)# <b>end</b>	Exits out of IPv6 Source Guard policy configuration mode.
<b>Step 6</b>	<b>show ipv6 source-guard policy <i>policy_name</i></b> <b>Example:</b> Device# <b>show ipv6 source-guard policy example_policy</b>	Shows the policy configuration and all the interfaces where the policy is applied.

**What to do next**

Apply the IPv6 Source Guard policy to an interface.

# How to Configure IPv6 Prefix Guard

**Note** To allow routing protocol control packets sourced by a link-local address when prefix guard is applied, enable the permit link-local command in the source-guard policy configuration mode.

## SUMMARY STEPS

1. enable
2. configure terminal
3. [no] **ipv6 source-guard policy** *source-guard-policy*
4. [no] **validate address**
5. **validate prefix**
6. exit
7. **show ipv6 source-guard policy** [*source-guard-policy*]

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 3</b>	<p><code>[ no ] ipv6 source-guard policy <i>source-guard-policy</i></code></p> <p><b>Example:</b></p> <pre>Device (config)# ipv6 source-guard policy my_snooping_policy</pre>	Defines an IPv6 source-guard policy name and enters switch integrated security features source-guard policy configuration mode.
<b>Step 4</b>	<p><code>[ no ] validate address</code></p> <p><b>Example:</b></p> <pre>Device (config-sisf-sourceguard)# no validate address</pre>	Disables the validate address feature and enables the IPv6 prefix guard feature to be configured.
<b>Step 5</b>	<p><code>validate prefix</code></p> <p><b>Example:</b></p> <pre>Device (config-sisf-sourceguard)# validate prefix</pre>	Enables IPv6 source guard to perform the IPv6 prefix-guard operation.
<b>Step 6</b>	<p><code>exit</code></p> <p><b>Example:</b></p> <pre>Device (config-sisf-sourceguard)# exit</pre>	Exits switch integrated security features source-guard policy configuration mode and returns to privileged EXEC mode.
<b>Step 7</b>	<p><code>show ipv6 source-guard policy [<i>source-guard-policy</i>]</code></p> <p><b>Example:</b></p> <pre>Device # show ipv6 source-guard policy policy1</pre>	Displays the IPv6 source-guard policy configuration.

## CHAPTER 93

# Configuring Cisco TrustSec

---

- [Information about Cisco TrustSec, on page 1927](#)
- [Finding Feature Information, on page 1927](#)
- [Cisco TrustSec Features, on page 1928](#)
- [Feature Information for Cisco TrustSec, on page 1930](#)

## Information about Cisco TrustSec

Cisco TrustSec provides security improvements to Cisco network devices based on the capability to strongly identify users, hosts, and network devices within a network. TrustSec provides topology-independent and scalable access controls by uniquely classifying data traffic for a particular role. TrustSec ensures data confidentiality and integrity by establishing trust among authenticated peers and encrypting links with those peers.

The key component of Cisco TrustSec is the Cisco Identity Services Engine (ISE). Cisco ISE can provision switches with TrustSec Identities and Security Group ACLs (SGACLs), though these may be configured manually on the switch.

## Finding Feature Information

To configure Cisco Trustsec on the switch, see the Cisco TrustSec Switch Configuration Guide at the following URL:

<https://www.cisco.com/c/en/us/td/docs/switches/lan/trustsec/configuration/guide/trustsec.html>

Release notes for Cisco TrustSec General Availability releases are at the following URL:

[https://www.cisco.com/c/en/us/td/docs/switches/lan/trustsec/release/notes/rn\\_cts\\_crossplat.html](https://www.cisco.com/c/en/us/td/docs/switches/lan/trustsec/release/notes/rn_cts_crossplat.html)

For restrictions and limitations on Catalyst 3850 and 3650, see the notes available at the following URL:

[http://www.cisco.com/c/en/us/td/docs/switches/lan/trustsec/configuration/guide/trustsec/appa\\_cat3k.html](http://www.cisco.com/c/en/us/td/docs/switches/lan/trustsec/configuration/guide/trustsec/appa_cat3k.html)

Additional information about the Cisco TrustSec solution, including overviews, datasheets, features by platform matrix, and case studies, is available at the following URL:

<https://www.cisco.com/c/en/us/solutions/enterprise-networks/trustsec/index.html>

## Cisco TrustSec Features

The table below lists the TrustSec features to be eventually implemented on TrustSec-enabled Cisco switches. Successive general availability releases of TrustSec will expand the number of switches supported and the number of TrustSec features supported per switch.

Cisco TrustSec Feature	Description
802.1AE Tagging (MACsec)	<p>Protocol for IEEE 802.1AE-based wire-rate hop-to-hop Layer 2 encryption.</p> <p>Between MACsec-capable devices, packets are encrypted on egress from the transmitting device, decrypted on ingress to the receiving device, and in the clear within the devices.</p> <p>This feature is only available between TrustSec hardware-capable devices.</p> <p><b>Note</b> This feature is not supported on Catalyst 3850 and Catalyst 3650 switches with Cisco IOS XE Denali 16.1.1</p> <p><b>Note</b> This feature is not supported on Catalyst 2960x.</p>
Endpoint Admission Control (EAC)	<p>EAC is an authentication process for an endpoint user or a device connecting to the TrustSec domain. Usually EAC takes place at the access level switch. Successful authentication and authorization in the EAC process results in Security Group Tag assignment for the user or device. Currently EAC can be 802.1X, MAC Authentication Bypass (MAB), and Web Authentication Proxy (WebAuth).</p>
Network Device Admission Control (NDAC)	<p>NDAC is an authentication process where each network device in the TrustSec domain can verify the credentials and trustworthiness of its peer device. NDAC utilizes an authentication framework based on IEEE 802.1X port-based authentication and uses EAP-FAST as its EAP method. Successful authentication and authorization in NDAC process results in Security Association Protocol negotiation for IEEE 802.1AE encryption.</p> <p><b>Note</b> This feature is not supported on Catalyst 2960x.</p>
Security Group Access Control List (SGACL)	<p>A Security Group Access Control List (SGACL) associates a Security Group Tag with a policy. The policy is enforced upon SGT-tagged traffic egressing the TrustSec domain.</p>

Cisco TrustSec Feature	Description
Security Association Protocol (SAP)	<p>After NDAC authentication, the Security Association Protocol (SAP) automatically negotiates keys and the cipher suite for subsequent MACSec link encryption between TrustSec peers. SAP is defined in IEEE 802.11i.</p> <p><b>Note</b> This feature is not supported on Catalyst 3850 and Catalyst 3650 switches with Cisco IOS XE Denali 16.1.1</p> <p><b>Note</b> This feature is not supported on Catalyst 2960x.</p>
Security Group Tag (SGT)	An SGT is a 16-bit single label indicating the security classification of a source in the TrustSec domain. It is appended to an Ethernet frame or an IP packet.
SGT Exchange Protocol (SXP)	Security Group Tag Exchange Protocol (SXP). With SXP, devices that are not TrustSec-hardware-capable can receive SGT attributes for authenticated users and devices from the Cisco Identity Services Engine (ISE) or the Cisco Secure Access Control System (ACS). The devices can then forward a sourceIP-to-SGT binding to a TrustSec-hardware-capable device will tag the source traffic for SGACL enforcement.

When both ends of a link support 802.1AE MACsec, SAP negotiation occurs. An EAPOL-key exchange occurs between the supplicant and the authenticator to negotiate a cipher suite, exchange security parameters, and manage keys. Successful completion of these tasks results in the establishment of a security association (SA).

Depending on your software version and licensing and link hardware support, SAP negotiation can use one of these modes of operation:

- Galois Counter Mode (GCM)—authentication and encryption
- GCM authentication (GMAC)— GCM authentication, no encryption
- No Encapsulation—no encapsulation (clear text)
- Null—encapsulation, no authentication or encryption

# Feature Information for Cisco TrustSec

*Table 158: Feature Information for Cisco TrustSec*

Feature Name	Release	Feature Information
<ul style="list-style-type: none"> <li>• NDAC</li> <li>• SXPv1, SXPv2</li> <li>• SGT</li> <li>• SGACL Layer2 Enforcement</li> <li>• Interface to SGT and VLAN to SGT mapping.</li> <li>• Subnet to SGT mapping</li> <li>• Layer 3 Port Mapping (PM)</li> <li>• Layer 3 Identity Port Mapping (IPM)</li> <li>• Security Group Name Download</li> <li>• SXP Loop Detection</li> <li>• Policy-based CoA</li> </ul>	Cisco IOS XE 3.3SE	These features were introduced on the Catalyst 3850 and 3650 switches and the Cisco 5700 Series Wireless LAN Controllers.
SXPv1 and SXPv2	Cisco IOS XE 15.0(2)EX	SXP is introduced on the Catalyst 2960-X switch.
SXPv1 and SXPv2	Cisco IOS XE 15.0(2)EX1	SXP is introduced on the Catalyst 2960-XR switch.

# Configuring Control Plane Policing

- [Finding Feature Information, on page 1931](#)
- [Restrictions for CoPP, on page 1931](#)
- [Information About Control Plane Policing, on page 1932](#)
- [How to Configure CoPP, on page 1935](#)
- [Examples for Configuring CoPP, on page 1939](#)
- [Monitoring CoPP, on page 1942](#)
- [Additional References for CoPP, on page 1943](#)
- [Feature History and Information For CoPP, on page 1944](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Restrictions for CoPP

Restrictions for control plane policing (CoPP) include the following:

- Only ingress CoPP is supported. The **system-cpp-policy** policy-map is available on the control plane interface, only in the ingress direction.
- Only the **system-cpp-policy** policy-map can be installed on the control plane interface.
- The **system-cpp-policy** policy-map and the seventeen system-defined classes cannot be modified or deleted.
- Only the **police** action is allowed under the **system-cpp-policy** policy-map. Further, the **police rate** can be configured only in packets per second (pps).

- One or more CPU queues are part of each class-map. Where multiple CPU queues belong to one class-map, changing the policer rate of a class-map affects all CPU queues that belong to that class-map. Similarly, disabling a class-map disables all queues that belong to that class-map. See [Table 159: System-Defined Values for CoPP, on page 1933](#) for information about which CPU queues belong to each class-map.

## Information About Control Plane Policing

This chapter describes how control plane policing (CoPP) works on your device and how to configure it.

### CoPP Overview

The CoPP feature improves security on your device by protecting the CPU from unnecessary traffic, or DoS traffic, and by prioritizing control plane and management traffic.

Your device is typically segmented into three planes of operation, each with its own objective:

- The data plane, to forward data packets.
- The control plane, to route data correctly.
- The management plane, to manage network elements.

You can use CoPP to protect most of the CPU-bound traffic and ensure routing stability, reachability, and packet delivery. Most importantly, you can use CoPP to protect the CPU from a DoS attack.

CoPP uses the modular QoS command-line interface (MQC) and CPU queues to achieve these objectives. Different types of control plane traffic are grouped together based on certain criteria, and assigned to a CPU queue. You can manage these CPU queues by configuring dedicated policers in hardware. For example, you can modify the policer rate for certain CPU queues (traffic-type), or you can disable the policer for a certain type of traffic.

Although the policers are configured in hardware, CoPP does not affect CPU performance or the performance of the data plane. But since it limits the number of packets going to CPU, the CPU load is controlled. This means that services waiting for packets from hardware may see a more controlled rate of incoming packets (the rate being user-configurable).

### System-Defined Aspects of CoPP

When you power-up the device for the first time, the system automatically performs the following tasks:

- It looks for policy-map **system-cpp-policy**. If it does not detect this policy-map, it creates and installs it on the control-plane.
- It creates seventeen class-maps under **system-cpp-policy**.

The next time you power-up the device, the system detects the policy and class maps that have already been created.

- Once the policy is installed, sixteen (out of the thirty-two) CPU queues are enabled by default with their respective default rate. The CPU queues enabled by default and their default rates are indicated in [Table 159: System-Defined Values for CoPP, on page 1933](#).

The following table lists the class-maps that the system creates when you load the device. It lists the policer that corresponds to each class-map and one or more CPU queues that are grouped under each class-map. There is a one-to-one mapping of class-maps to policers; and one or more CPU queues map to a class-map.

**Table 159: System-Defined Values for CoPP**

Class Maps Names	Policer Index (Policer No.)	CPU queues (Queue No.)	CPU Queues Enabled by Default?	Default Policer Rate—in packets per second (pps)
system-cpp-police-data	WK_CPP_POLICE_DATA(0)	WK_CPU_Q_ICMP_GEN(3) WK_CPU_Q_BROADCAST(12)	Yes	200

## User-Configurable Aspects of CoPP

You can perform these tasks to manage control plane traffic:

- Enable or disable CPU queues.

Enable a CPU queue, by configuring a policer action (in packets per second) under the corresponding class-map, within the **system-cpp-policy** policy-map.

Disable a CPU queue, by removing the policer action under the corresponding class-map, within the **system-cpp-policy** policy-map.

- Change the policer rate, by configuring a policer rate action (in packets per second) under the corresponding class-map, within the **system-cpp-policy** policy-map.
- Set the CPU queues to their default values, by entering the **cpp system-default** command in global configuration mode.

# How to Configure CoPP

## Enabling a CPU Queue or Changing the Policer Rate

The procedure to enable a CPU queue and change the policer rate of a CPU queue is the same. Follow these steps:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map** *policy-map-name*
4. **class** *class-name*
5. **service-policy input** *policy-name*
6. **police rate** *rate* **pps**
7. **end**
8. **show running-config** | **begin system-cpp-policy**

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<b>configure terminal</b> <b>Example:</b>	Enters the global configuration mode.

	Command or Action	Purpose
	Device# <code>configure terminal</code>	
<b>Step 3</b>	<b>policy-map</b> <i>policy-map-name</i> <b>Example:</b> Device(config)# <code>policy-map system-cpp-policy</code> Device(config-pmap)#	Enters the policy map configuration mode.
<b>Step 4</b>	<b>class</b> <i>class-name</i> <b>Example:</b> Device(config-pmap)# <code>class system-cpp-police-protocol-snooping</code> Device(config-pmap-c)#	Enters the class action configuration mode. Enter the name of the class that corresponds to the CPU queue you want to enable. See <a href="#">Table 159: System-Defined Values for CoPP, on page 1933</a>
<b>Step 5</b>	<b>service-policy input</b> <i>policy-name</i> <b>Example:</b> Device(config)# <code>control-plane</code> Device(config-cp)# <code>service-policy input system-cpp-policy</code> Device(config-cp)#	Installs system-cpp-policy in FED. This command is required for you to see the FED policy. Not configuring this command will lead to an error.
<b>Step 6</b>	<b>police rate</b> <i>rate</i> <b>pps</b> <b>Example:</b> Device(config-pmap-c)# <code>police rate 100 pps</code>	Specifies an upper limit on the number of incoming packets processed per second, for the specified traffic class. <b>Note</b> The rate you specify is applied to all CPU queues that belong to the class-map you have specified.
<b>Step 7</b>	<b>end</b> <b>Example:</b> Device(config-pmap-c)# <code>end</code>	Returns to the privileged EXEC mode.
<b>Step 8</b>	<b>show running-config   begin system-cpp-policy</b> <b>Example:</b> Device# <code>show running-config   begin system-cpp-policy</code>	Displays the rates configured for the various traffic types.

## Disabling a CPU Queue

Follow these steps to disable a CPU queue:

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **policy-map** *policy-map-name*
4. **class** *class-name*
5. **no police rate** *rate* **pps**
6. **end**
7. **show running-config** | **begin system-cpp-policy**

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>enable</b> <b>Example:</b> Device> <b>enable</b>	Enables privileged EXEC mode. Enter your password if prompted.
<b>Step 2</b>	<b>configure terminal</b> <b>Example:</b> Device# <b>configure terminal</b>	Enters the global configuration mode.
<b>Step 3</b>	<b>policy-map</b> <i>policy-map-name</i> <b>Example:</b> Device(config)# <b>policy-map system-cpp-policy</b> Device(config-pmap)#	Enters the policy map configuration mode.
<b>Step 4</b>	<b>class</b> <i>class-name</i> <b>Example:</b> Device(config-pmap)# <b>class</b> <b>system-cpp-police-protocol-snooping</b> Device(config-pmap-c)#	Enters the class action configuration mode. Enter the name of the class that corresponds to the CPU queue you want to disable. See <a href="#">Table 159: System-Defined Values for CoPP, on page 1933</a>
<b>Step 5</b>	<b>no police rate</b> <i>rate</i> <b>pps</b> <b>Example:</b> Device(config-pmap-c)# <b>no police rate 100 pps</b>	Disables incoming packet processing for the specified traffic class.  <b>Note</b> This disables all CPU queues that belong to the class-map you have specified.

	Command or Action	Purpose
<b>Step 6</b>	<b>end</b> <b>Example:</b> Device(config-pmap-c)# <b>end</b>	Returns to the privileged EXEC mode.
<b>Step 7</b>	<b>show running-config   begin system-cpp-policy</b> <b>Example:</b> Device# <b>show running-config   begin system-cpp-policy</b>	Displays the rates configures for the various traffic types.

## Examples for Configuring CoPP

### Example: Enabling a CPU Queue or Changing the Policer Rate of a CPU Queue

This example shows how to enable a CPU queue or to change the policer rate of a CPU queue. Here the **class system-cpp-police-protocol-snooping** CPU queue is enabled with the policer rate of **100 pps**.

```
Device> enable
Device# configure terminal
Device(config)# policy-map system-cpp-policy
Device(config-pmap)# class system-cpp-police-protocol-snooping
Device(config-pmap-c)# police rate 100 pps
Device(config-pmap-c)# end
```

```
Device# show running-config | begin system-cpp-policy
```

```
policy-map system-cpp-policy
```

```

class system-cpp-police-data
 police rate 200 pps
class system-cpp-police-sys-data
 police rate 100 pps
class system-cpp-police-sw-forward
 police rate 1000 pps
class system-cpp-police-multicast
 police rate 500 pps
class system-cpp-police-multicast-end-station
 police rate 2000 pps
class system-cpp-police-punt-webauth
class system-cpp-police-l2-control
class system-cpp-police-routing-control
 police rate 500 pps
class system-cpp-police-control-low-priority
class system-cpp-police-wireless-priority1
class system-cpp-police-wireless-priority2
class system-cpp-police-wireless-priority3-4-5
class system-cpp-police-topology-control
class system-cpp-police-dot1x-auth
class system-cpp-police-protocol-snooping
 police rate 100 pps
class system-cpp-police-forus
class system-cpp-default

```

## Example: Setting the Default Policer Rates for All CPU Queues

This example shows how to set the policer rates for all CPU queues to their default and then verify the setting:

```

Device> enable
Device# configure terminal
Device(config)# cpp system-default
Defaulting CPP : Policer rate for all classes will be set to their defaults
Device(config)# end

```

```

Device# show platform hardware fed switch 1 qos queue stats internal cpu policer

```

## Feature History and Information For CoPP

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

<b>Feature Name</b>	<b>Releases</b>	<b>Feature Information</b>
Control Plane Policing (CoPP) or CPP	Cisco IOS XE 3.2SE	This feature was introduced.
CLI configuration for CoPP	Cisco IOS XE Denali 16.1.2	This feature was made user-configurable. CLI configuration options to enable and disable CPU queues, to change the policer rate, and to set policer rates to default.

## CHAPTER 95

# Configuring Wireless Guest Access

---

- [Finding Feature Information, on page 1945](#)
- [Prerequisites for Guest Access, on page 1945](#)
- [Restrictions for Guest Access, on page 1946](#)
- [Information about Wireless Guest Access, on page 1946](#)
- [Fast Secure Roaming, on page 1946](#)
- [How to Configure Guest Access, on page 1947](#)
- [Configuration Examples for Guest Access, on page 1962](#)
- [Additional References for Guest Access, on page 1968](#)
- [Feature History and Information for Guest Access, on page 1969](#)

## Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

## Prerequisites for Guest Access

- All mobility peers should be configured for hierarchical mobility architecture.
  - For Guest Controller Mobility Anchor configuration on WLAN is must on Mobility Agent and Guest Controller.
  - Guest Access can be a 3 box solution or 2 box solution. The mobility tunnel link status should be up between:
    - Mobility Agent, Mobility Controller and Guest Controller.
- or
- Mobility Agent/Mobility Controller and Guest Controller

# Restrictions for Guest Access

## Information about Wireless Guest Access

Ideally, the implementation of a wireless guest network uses as much of an enterprise's existing wireless and wired infrastructure as possible to avoid the cost and complexity of building a physical overlay network. Assuming this is the case, the following additional elements and functions are needed:

- A dedicated guest WLAN/SSID—Implemented throughout the campus wireless network wherever guest access is required. A guest WLAN is identified by a WLAN with mobility anchor (Guest Controller) configured.
- Guest traffic segregation—Requires implementing Layer 2 or Layer 3 techniques across the campus network to restrict where guests are allowed to go.
- Access control—Involves using imbedded access control functionality within the campus network or implementing an external platform to control guest access to the Internet from the enterprise network.
- Guest user credential management—A process by which a sponsor or lobby administrator can create temporary credentials in behalf of a guest. This function might be resident within an access control platform or it might be a component of AAA or some other management system.

## Fast Secure Roaming

Fast secure roaming can be achieved by caching the Pairwise Master Key (PMK) information for Cisco Centralized Key Management (CCKM), and 802.11i clients. Cisco Centralized Key Management (CCKM) helps to improve roaming. Only the client can initiate the roaming process, which depends on factors such as:

- Overlap between APs
- Distance between APs
- Channel, signal strength, and load on the AP
- Data rates and output power

Whenever a fast-roaming client 802.11i, [CCKM]) roams to a new device, after fast-roaming the clients go through mobility "handoff" procedure. And new AAA attributes learned through mobility "handoff" procedure get re-applied.

Full L2 authentication must be avoided during roaming if the client uses the 802.11i WPA2, CCKM, to achieve the full requirements of fast secure roaming. The PMK cache (802.11i, CCKM) is used to authenticate and derive the keys for roaming clients to avoid full L2 authentication. This requires all Mobility Anchors (MA) and Mobility Controllers (MC) in the mobility group to have the same PMK cache values.

The session timeout defines when a PMK cache will expire. A PMK cache can also be deleted when a client fails to re-authenticate or when it is manually deleted them from the CLI. The deletion on the original controller or switch shall be propagated to other controllers or switches in the same mobility group.

# How to Configure Guest Access

## Creating a Lobby Administrator Account

### SUMMARY STEPS

1. `configure terminal`
2. `user-name user-name`
3. `type lobby-admin`
4. `password 0 password`
5. `end`
6. `show running-config | section user-name` (or) `show running-config | section configured lobby admin username`

### DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>configure terminal</code> <b>Example:</b> Device # <code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>user-name user-name</code> <b>Example:</b> Device (config)# <code>user-name lobby</code>	Creates a user account.
Step 3	<code>type lobby-admin</code> <b>Example:</b> Device (config-user-name)# <code>type lobby-admin</code>	Specifies the account type as lobby admin.
Step 4	<code>password 0 password</code> <b>Example:</b> Device (config-user-name)# <code>password 0 lobby</code>	Creates a password for the lobby administrator account.
Step 5	<code>end</code> <b>Example:</b> Device (config-user-name)# <code>end</code>	Returns to privileged EXEC mode.
Step 6	<code>show running-config   section user-name</code> (or) <code>show running-config   section configured lobby admin username</code> <b>Example:</b> Device # <code>show running-config   section lobby</code>	Displays the configuration details.

## Example

## Configuring Guest User Accounts

### SUMMARY STEPS

1. **configure terminal**
2. **user-name** *user-name*
3. **password** *unencrypted/hidden-password password*
4. **type network-user description** *description* **guest-user lifetime** *year 0-1 month 0-11 day 0-30 hour 0-23 minute 0-59 second 0-59*
5. **end**
6. **show aaa local netuser all**
7. **show running-config** | section *user-name*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device # <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>user-name</b> <i>user-name</i> <b>Example:</b> Device (config)# <b>user-name</b> guest	Creates a username for the lobby ambassador account.
<b>Step 3</b>	<b>password</b> <i>unencrypted/hidden-password password</i> <b>Example:</b> Device (config-user-name)# <b>password</b> 0 guest	Specifies the password for the user.
<b>Step 4</b>	<b>type network-user description</b> <i>description</i> <b>guest-user lifetime</b> <i>year 0-1 month 0-11 day 0-30 hour 0-23 minute 0-59 second 0-59</i> <b>Example:</b> Device (config-user-name)# <b>type network-user description</b> guest <b>guest-user lifetime</b> <b>year</b> 1 <b>month</b> 10 <b>day</b> 3 <b>hour</b> 1 <b>minute</b> 5 <b>second</b> 30	Specifies the type of user.
<b>Step 5</b>	<b>end</b> <b>Example:</b> Device (config-user-name)# <b>end</b>	Returns to privileged EXEC mode.
<b>Step 6</b>	<b>show aaa local netuser all</b> <b>Example:</b>	Displays the configuration details. After the lifetime, the user-name with guest type will be deleted and the client

	Command or Action	Purpose
	Device # <code>show aaa local netuser all</code>	associated with the guest user-name will be de-authenticated.
<b>Step 7</b>	<b>show running-config   section</b> <i>user-name</i> <b>Example:</b> Device # <code>show running-config   section guest</code>	Displays the configuration details.

### Example

## Configuring Mobility Agent (MA)

### SUMMARY STEPS

1. **configure terminal**
2. **wireless mobility controller** *ipmc-ipaddress* **public-ip** *mc-publicipaddress*
3. **wlan** *wlan-name* *wlan-id* *ssid*
4. **client vlan id***vlan-group name/vlan-id*
5. **no security wpa**
6. **mobility anchor** *ipaddress*
7. **aaa-override**
8. **no shutdown**
9. **end**
10. **show wireless mobility summary**
11. **show wlan name** *wlan-name/id*

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device # <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>wireless mobility controller</b> <i>ipmc-ipaddress</i> <b>public-ip</b> <i>mc-publicipaddress</i> <b>Example:</b> Device (config) # <code>wireless mobility controller ip27.0.0.1 public-ip 27.0.0.1</code>	Configures the Mobility Controller to which the MA will be associated.
<b>Step 3</b>	<b>wlan</b> <i>wlan-name</i> <i>wlan-id</i> <i>ssid</i> <b>Example:</b> Device (config) # <code>wlan mywlan 34 mywlan-ssid</code>	<ul style="list-style-type: none"> <li>• For <i>wlan-name</i> enter, enter the profile name. The range is 1- 32 characters.</li> <li>• For <i>wlan-id</i>, enter the WLAN ID. The range is 1-512.</li> </ul>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <li>For <i>ssid</i>, enter the Service Set Identifier (SSID) for this WLAN. If the SSID is not specified, the WLAN profile name is set as the SSID.</li> </ul>
<b>Step 4</b>	<b>client vlan id</b> <i>vlan-group name/vlan-id</i> <b>Example:</b> Device (config-wlan) # <b>client vlan VLAN0136</b>	Configures the VLAN id or group of the WLAN.
<b>Step 5</b>	<b>no security wpa</b> <b>Example:</b> Device (config-wlan) # <b>no security wpa</b>	The security configuration must be the same for the WLAN created on the GC. This example is for open authentication. For other security types such as open and webauth, appropriate command should be provided.
<b>Step 6</b>	<b>mobility anchor</b> <i>ipaddress</i> <b>Example:</b> Device (config-wlan) # <b>mobility anchor 9.3.32.2</b>	Configures the Guest Controller as mobility anchor.
<b>Step 7</b>	<b>aaa-override</b> <b>Example:</b> Device (config-wlan) # <b>aaa-override</b>	(Optional) Enables AAA override. AAA override is required for non open authentication in case AAA attributes are to be prioritized. It is required only in case guest user need to be deauthenticated after lifetime or have to give aaa-override attribute to the user.
<b>Step 8</b>	<b>no shutdown</b> <b>Example:</b> Device (config-wlan) # <b>no shutdown</b>	Enables the WLAN.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device (config) # <b>end</b>	Returns to privileged EXEC mode.
<b>Step 10</b>	<b>show wireless mobility summary</b> <b>Example:</b> Device # <b>show wireless mobility summary</b>	Verifies the mobility controller IP address and mobility tunnel status.
<b>Step 11</b>	<b>show wlan name</b> <i>wlan-name/id</i> <b>Example:</b> Device # <b>show wlan name mywlan</b>	Displays the configuration of mobility anchor.

### Example

## Configuring Mobility Controller

Mobility Controller mode should be enabled using the **wireless mobility controller** command.

## SUMMARY STEPS

1. **configure terminal**
2. **wireless mobility group member ip** *ip-address* **public-ip** *ip-address* **group** *group-name*
3. **wireless mobility controller peer-group** *peer-group-name*
4. **wireless mobility controller peer-group** *peer-group-name* **member ip** *ipaddress* **public-ip** *ipaddress*
5. **end**
6. **show wireless mobility summary**

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b>  <b>Example:</b> Device # <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>wireless mobility group member ip</b> <i>ip-address</i> <b>public-ip</b> <i>ip-address</i> <b>group</b> <i>group-name</i>  <b>Example:</b> Device (config) # <b>wireless mobility group member ip</b> 27.0.0.1 <b>public-ip</b> 23.0.0.1 <b>group</b> test	Adds all peers within the MC group. The <i>ip-address</i> should be the guest controller's IP address.
Step 3	<b>wireless mobility controller peer-group</b> <i>peer-group-name</i>  <b>Example:</b> Device (config) # <b>wireless mobility controller peer-group</b> pg	Creates the switch peer group.
Step 4	<b>wireless mobility controller peer-group</b> <i>peer-group-name</i> <b>member ip</b> <i>ipaddress</i> <b>public-ip</b> <i>ipaddress</i>  <b>Example:</b> Device (config) # <b>wireless mobility controller peer-group</b> pg <b>member ip</b> 9.7.136.10 <b>public-ip</b> 9.7.136.10	Adds the MA to the switch peer group.
Step 5	<b>end</b>  <b>Example:</b> Device (config) # <b>end</b>	Returns to privileged EXEC mode.
Step 6	<b>show wireless mobility summary</b>  <b>Example:</b> Device # <b>show wireless mobility summary</b>	Displays the configuration details.

## Example

## Obtaining a Web Authentication Certificate

### SUMMARY STEPS

1. `configure terminal`
2. `crypto pki import trustpoint name pkcs12 tftp: passphrase`
3. `end`
4. `show crypto pki trustpoints cert`

### DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device # <code>configure terminal</code>	Enters global configuration mode.
<b>Step 2</b>	<b>crypto pki import trustpoint name pkcs12 tftp: passphrase</b> <b>Example:</b> Device (config)# <code>crypto pki import cert pkcs12 tftp://9.1.0.100/ldapsver-cert.p12 cisco</code>	Imports certificate.
<b>Step 3</b>	<b>end</b> <b>Example:</b> Device (config)# <code>end</code>	Returns to privileged EXEC mode.
<b>Step 4</b>	<b>show crypto pki trustpoints cert</b> <b>Example:</b> Device # <code>show crypto pki trustpoints cert</code>	Displays the configuration details.

## Example

## Displaying a Web Authentication Certificate

### SUMMARY STEPS

1. `show crypto ca certificate verb`

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>show crypto ca certificate verb</b> <b>Example:</b> Device # <b>show crypto ca certificate verb</b>	Displays the current web authentication certificate details.

## Example

## Choosing the Default Web Authentication Login Page

AAA override flag should be enabled on the WLAN for web authentication using local or remote AAA server.

## SUMMARY STEPS

1. **configure terminal**
2. **parameter-map type webauth** *parameter-map name*
3. **wlan** *wlan-name*
4. **shutdown**
5. **security web-auth**
6. **security web-auth authentication-list** *authentication list name*
7. **security web-auth parameter-map** *parameter-map name*
8. **no shutdown**
9. **end**
10. **show running-config** | section *wlan-name*
11. **show running-config** | section **parameter-map type webauth** *parameter-map*

## DETAILED STEPS

	Command or Action	Purpose
Step 1	<b>configure terminal</b> <b>Example:</b> Device # <b>configure terminal</b>	Enters global configuration mode.
Step 2	<b>parameter-map type webauth</b> <i>parameter-map name</i> <b>Example:</b> Device (config) # <b>parameter-map type webauth test</b>	Configures the web-auth parameter-map.
Step 3	<b>wlan</b> <i>wlan-name</i> <b>Example:</b> Device (config) # <b>wlan wlan10</b>	For the wlan-name, enter the profile name. The range is 1- 32 characters.
Step 4	<b>shutdown</b> <b>Example:</b>	Disables WLAN.

	Command or Action	Purpose
	Device (config) # <b>shutdown</b>	
<b>Step 5</b>	<b>security web-auth</b> <b>Example:</b> Controller (config-wlan) # <b>security web-auth</b>	Enables web-auth on WLAN.
<b>Step 6</b>	<b>security web-auth authentication-list <i>authentication list name</i></b> <b>Example:</b> Controller (config-wlan) # <b>security web-auth authentication-list test</b>	Allows you to map the authentication list name with the web-auth WLAN.
<b>Step 7</b>	<b>security web-auth parameter-map <i>parameter-map name</i></b> <b>Example:</b> Device (config) # <b>security web-auth parameter-map test</b>	Allows you to map the parameter-map name with the web-auth WLAN.
<b>Step 8</b>	<b>no shutdown</b> <b>Example:</b> Device (config) # <b>no shutdown</b>	Enables the WLAN.
<b>Step 9</b>	<b>end</b> <b>Example:</b> Device (config) # <b>end</b>	Returns to privileged EXEC mode.
<b>Step 10</b>	<b>show running-config   section <i>wlan-name</i></b> <b>Example:</b> Device# <b>show running-config   section mywlan</b>	Displays the configuration details.
<b>Step 11</b>	<b>show running-config   section parameter-map type webauth <i>parameter-map</i></b> <b>Example:</b> Device# <b>show running-config   section parameter-map type webauth test</b>	Displays the configuration details.

### Example

## Choosing a Customized Web Authentication Login Page from an External Web Server

AAA override flag should be enabled on the WLAN for web authentication using local or remote AAA server.

## SUMMARY STEPS

1. **configure terminal**
2. **parameter-map type webauth global**
3. **virtual-ip {ipv4 | ipv6} ip-address**
4. **parameter-map type webauth parameter-map name**
5. **type {authbypass | consent | webauth | webconsent}**
6. **redirect [for-login|on-success|on-failure] URL**
7. **redirect portal {ipv4 | ipv6} ip-address**
8. **end**
9. show running-config | section parameter-map

## DETAILED STEPS

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device # <b>configure terminal</b>	Enters global configuration mode.
<b>Step 2</b>	<b>parameter-map type webauth global</b> <b>Example:</b> Device (config) # <b>parameter-map type webauth global</b>	Configures a global webauth type parameter.
<b>Step 3</b>	<b>virtual-ip {ipv4   ipv6} ip-address</b> <b>Example:</b> Device (config-params-parameter-map) # <b>virtual-ip ipv4 1.1.1.1</b>	Configures the virtual IP address.
<b>Step 4</b>	<b>parameter-map type webauth parameter-map name</b> <b>Example:</b> Device (config-params-parameter-map) # <b>parameter-map type webauth test</b>	Configures the webauth type parameter.
<b>Step 5</b>	<b>type {authbypass   consent   webauth   webconsent}</b> <b>Example:</b> Device (config-params-parameter-map) # <b>type webauth</b>	Configures webauth subtypes such as consent, passthru, webauth, or webconsent.
