Prerequisites for a Virtual Services Container

- A Cisco device installed with an operating system release that supports virtual services and has the needed system infrastructure required for specific applications like Cisco Plug-In for OpenFlow.

Note Refer to the corresponding release notes for information about which operating system release supports the features and necessary infrastructure.

- Release notes for [Cisco Catalyst 3850 Series Switches](#)

Note Refer to the corresponding release notes for information about which operating system release supports the features and necessary infrastructure.

- Release notes for [Cisco Catalyst 3650 Series Switches](#)

-
- An open virtual application (OVA) package that is compatible with the device operating system has been downloaded from an FTP server connected to the device. The OVA package is available for download in the same location as your system image (.bin) file.
 - Enough memory is available for the installation and deployment of the application. The container and its applications require 256 MB.

Information about Virtual Services Container

Virtual Services Containers and Applications

A virtual services container is a virtualized environment on a device. It is also referred to as a virtual machine (VM), virtual service, or container.

You can install an application within a virtual services container. The application runs in the virtual services container of the operating system of a device. The application is delivered as an open virtual application (OVA), which is a tar file with a .ova extension. The OVA package is installed and enabled on a device through the device CLI.

Cisco Plug-In for OpenFlow is an example of an application that can be deployed within a virtual services container.

Some of the files that can be found in an OVA file are the following:

- Virtual machine definition file, in libvirt XML format, with Cisco extensions.
- Manifest file, listing the contents of a distribution. It contains the hash information for each file in the OVA package.
- Certificate file containing the signature of a manifest file. This file is used in validating the integrity of an OVA package.
- Version file, used to check compatibility with the virtualization infrastructure.

How to Configure a Virtual Services Container

Installing and Activating an Application in a Virtual Services Container

This task copies an open virtual application (OVA) package from an FTP file location, installs the application in a virtual services container, provisions the application, and activates it.

SUMMARY STEPS

1. **enable**
2. **copy** *from://source-directory-url destination-directory-url*
3. **virtual-service install name** *virtual-services-name* **package file**
4. **configure terminal**
5. **virtual-service** *virtual-services-name*
6. **activate**
7. **end**
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>enable</p> <p>Example:</p> <pre>Switch> enable</pre>	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	<p>copy <i>from://source-directory-url destination-directory-url</i></p> <p>Example:</p> <pre>Switch# copy tftp://myserver.com/downloads/ofa-1.1.64144n-cat3000-SSA-k9.ova flash: ofa-1.1.64144n-cat3000-SSA-k9.ova</pre>	<p>Downloads the new OVA package to the device for upgrade. Possible values are:</p> <ul style="list-style-type: none"> • flash: • tftp: <p>Ensure you have configured the ip tftp source-interface <i>mgmt_interface</i> for the tftp to be usable.</p>
Step 3	<p>virtual-service install name <i>virtual-services-name</i> package file</p> <p>Example:</p> <pre>Switch# virtual-service install name openflow_agent package flash: ofa-1.1.64144n-cat3000-SSA-k9.ova</pre>	<p>Installs an OVA package from the specified location onto a device. Ensure that the ova file is located in the root directory of the storage device</p> <p>The <i>virtual-services-name</i> defined here should be used in all occurrences of this argument in this document.</p>
Step 4	<p>configure terminal</p> <p>Example:</p> <pre>Switch# configure terminal</pre>	Enters the global configuration mode.

	Command or Action	Purpose
Step 5	virtual-service <i>virtual-services-name</i> Example: Switch(config)# virtual-service openflow_agent	Configures a virtual services container and enters virtual services configuration mode. Observe these guidelines: <ul style="list-style-type: none"> • Use the <i>virtual-services-name</i> defined during installation of the application. • Ensure that installation is complete before proceeding to the next step using the show virtual-service list command.
Step 6	activate Example: Switch(config-virt-serv)# activate	Activates the installed virtual services container.
Step 7	end Example: Switch(config-virt-serv)# end	Exits virtual services configuration mode and enters privileged EXEC mode.
Step 8	copy running-config startup-config Example: Switch# copy running-config startup-config	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

What to Do Next

You can now begin using your application.

Verifying Installation of Virtual Services Container Applications

SUMMARY STEPS

1. **show virtual-service [global]**
2. **show virtual-service detail [name *virtual-services-name*]**
3. **show virtual-service list**
4. **show virtual-service storage pool list**
5. **show virtual-service storage volume list**
6. **show virtual-service version name *virtual-services-name* installed**
7. **show virtual-service tech-support**
8. **show virtual-service redundancy state**
9. **show virtual-service utilization name *virtual-services-name***
10. **show virtual-service utilization statistics CPU**

DETAILED STEPS

Step 1 **show virtual-service [global]**

This command displays available memory, disk space, and CPU allocated for applications.

Example:

```
Switch# show virtual-service
```

Virtual Service Global State and Virtualization Limits:

```
Infrastructure version : 1.5
Total virtual services installed : 1
Total virtual services activated : 1
```

```
Machine types supported : LXC
Machine types disabled : KVM
```

```
Maximum VCPUs per virtual service : 1
Resource virtualization limits:
```

Name	Quota	Committed	Available
system CPU (%)	6	1	5
memory (MB)	256	256	0
flash (MB)	256	219	37

Step 2 **show virtual-service detail [name *virtual-services-name*]**

This command displays a list of resources committed to a specified application, including attached devices.

Example:

```
Switch# show virtual-service detail name openflow_agent
```

```
Virtual service openflow_agent detail
State : Activated
```

```

Package information
  Name           : ofa-1.1.64148n-cat3000-SSA-k9.ova
  Path           :
flash:/virtual-instance/OVA/openflow_agent/ofa-1.1.64148n-cat3000-SSA-k9.ova
Application
  Name           : CiscoPluginForOpenFlow
  Installed version : 1.1.64148n
  Description    : Cisco Plug-in for OpenFlow
Signing
  Key type      : Cisco key
  Method       : SHA-512
Licensing
  Name         : Not Available
  Version      : Not Available

Resource reservation
  Disk        : 135 MB
  Memory     : 256 MB
  CPU        : 1% system CPU

Attached devices
  Type          Name          Alias
-----
Disk           _rootfs
Disk           /mnt/ofa
Disk           /cisco/...
Serial/shell
Serial/aux
Serial/Syslog          serial2
Serial/Trace          serial3
Watchdog

```

Step 3 **show virtual-service list**

This command displays an overview of resources utilized by the applications.

Example:

```
Switch# show virtual-service list
```

Virtual Service List:

Name	Status	Package Name
openflow_agent	Activated	ofa-1.1.64148n-cat3000-SSA-k9.ova

Step 4 **show virtual-service storage pool list**

This command displays an overview of storage locations (pools) used for virtual service containers.

Example:

```
Switch# show virtual-service storage pool list
```

Virtual-Service storage pool list

Name	Pool Type	Path
------	-----------	------

```
-----
virt_strg_pool_fl      Directory    /flash/virt_strg_pool_fl
```

Step 5**show virtual-service storage volume list**

This command displays an overview of storage volume information for virtual service containers.

Example:

```
Switch# show virtual-service storage volume list
```

```
Virtual-Service storage volume list
```

```
Name                               Capacity    In Use    Virtual-Service
-----
_rootfs.openflow_agent             130 MB     Yes      openflow_agent
```

Step 6**show virtual-service version name *virtual-services-name* installed**

This command displays the version of an installed application.

Example:

```
Switch# show virtual-service version name openflow_agent installed
```

```
Virtual service openflow_agent installed version:
```

```
  Name : CiscoPluginForOpenFlow
  Version : 1.1.64148n
```

Step 7**show virtual-service tech-support**

Displays all relevant container-based information.

Step 8**show virtual-service redundancy state****Example:**

```
Switch# show virtual-service redundancy state
```

```
Virtual Service Redundancy State:
```

```
Switch No.      Role          Configure sync status    OVA sync status
-----
1               Active        N/A                      N/A
```

Displays state of virtual-services.

Step 9**show virtual-service utilization name *virtual-services-name*****Example:**

```
Switch# show virtual-service utilization name openflow_agent
```

```
Virtual-Service Utilization:
```

```
CPU Utilization:
```

```
  CPU Time: 0 % (30 second average)
  CPU State: R : Running
```

```
Memory Utilization:
```

```
  Memory Allocation: 262144 Kb
  Memory Used:      9308 Kb
```

```

Storage Utilization:
Name: _rootfs, Alias: _rootfs
  RD Bytes:      0
  RD Requests:  0
  Errors:        0
  Capacity(1K blocks): 128908
  Available(1K blocks): 39948

[Troubleshooting: Activating Applications in a Virtual Services Container](#)

Deactivating and Uninstalling an Application from a Virtual Services Container

(Optional) Perform this task to uninstall and deactivate an application from within a virtual services container.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **virtual-service** *virtual-services-name*
4. **no activate**
5. **no virtual-service** *virtual-services-name*
6. **end**
7. **virtual-service uninstall name** *virtual-services-name*
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	virtual-service <i>virtual-services-name</i> Example: Switch(config)# virtual-service openflow_agent	Enters virtual services configuration mode to configure a specified application. <ul style="list-style-type: none"> • Use the <i>virtual-services-name</i> defined during installation of the application.
Step 4	no activate Example: Switch(config-virt-serv)# no activate	Disables the application.
Step 5	no virtual-service <i>virtual-services-name</i> Example: Switch(config)# no virtual-service openflow_agent	Unprovisions the application. <ul style="list-style-type: none"> • Use the <i>virtual-services-name</i> defined during installation of the application. • This command is optional for all devices running Cisco IOS-XE.

	Command or Action	Purpose
Step 6	end Example: Switch(config-virt-serv) # end	Exits virtual services configuration mode and enters privileged EXEC mode.
Step 7	virtual-service uninstall name <i>virtual-services-name</i> Example: Switch# virtual-service uninstall name openflow_agent	Uninstalls the application. <ul style="list-style-type: none"> • Use the <i>virtual-services-name</i> defined during installation of the application. • Run this command only after receiving a successful deactivation response from the device.
Step 8	copy running-config startup-config Example: Switch# copy running-config startup-config	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

Configuration Examples for Virtual Services Container Installation

Example: Cisco Plug-In for OpenFlow Virtual Services Container Installation

```
Switch# enable
Switch# copy tftp://myserver.com/downloads/ofa-1.1.64148n-cat3000-SSA-k9.ova flash:
ofa-1.1.64148n-cat3000-SSA-k9.ova
Switch# virtual-service install name openflow_agent package
flash:/ofa-1.1.64148n-cat3000-SSA-k9.ova
Switch# configure terminal
Switch(config)# virtual-service openflow_agent
Switch(config-virt-serv)# activate
Switch(config-virt-serv)# end
Switch# copy running-config startup-config
```

Example: Verifying Cisco Plug-In for OpenFlow Virtual Services Container Installation

```
Switch# show virtual-service list
```

Virtual Service List:

Name	Status	Package Name
openflow_agent	Activated	
ofa-1.1.64148n-cat3000-SSA-k9.ova		

Upgrading a Virtual Services Container

The **virtual-service upgrade** command is not supported. Follow the instructions in the previous sections to deactivate, uninstall, then install and activate the new OVA.
