## **Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <a href="http://www.cisco.com/go/cfn">http://www.cisco.com/go/cfn</a>. An account on Cisco.com is not required.

# **Prerequisites for Wireshark**

• Wireshark is supported on Supervisor Engine 7-E, Supervisor Engine 7L-E, Catalyst 3850, Catalyst 3650, Wireless LAN Controller 5700 Series, Catalyst 4500X-16, and Catalyst 4500X-32.

## **Restrictions for Wireshark**

- Starting in Cisco IOS Release XE 3.3.0(SE), global packet capture on Wireshark is not supported.
- Capture filters are not supported.
- The CLI for configuring Wireshark requires that the feature be executed only from EXEC mode. Actions
  that usually occur in configuration submode (such as defining capture points), are handled at the EXEC
  mode instead. All key commands are not NVGEN'd and are not synchronized to the standby supervisor
  in NSF and SSO scenarios.
- Packets captured in the output direction of an interface might not reflect the changes made by switch rewrite (includes TTL, VLAN tag, CoS, checksum, MAC addresses, DSCP, precedent, UP, etc.).
- Limiting circular file storage by file size is not supported.

#### **Wireless Packet Capture**

- The only form of wireless capture is a CAPWAP tunnel capture.
- When capturing CAPWAP tunnels, no other interface types can be used as attachment points on the same capture point.
- Capturing multiple CAPWAP tunnels is supported.
- Core filters are not applied and should be omitted when capturing a CAPWAP tunnel.
- To capture a CAPWAP data tunnel, each CAPWAP tunnel is mapped to a physical port and an appropriate ACL will be applied to filter the traffic.
- To capture a CAPWAP non-data tunnel, the switch is set to capture traffic on all ports and apply an appropriate ACL to filter the traffic.

#### **Configuration Limitations**

- Multiple capture points can be defined, but only one can be active at a time. You need to stop one before you can start the other.
- Neither VRFs, management ports, nor private VLANs can be used as attachment points.
- Only one ACL of each type (IPv4, IPv6, MAC) is allowed in a Wireshark class map. There can be a maximum of three ACLs in a class map: one for IPv4, one for IPv6, and the other for MAC.
- Wireshark cannot capture packets on a destination SPAN port.
- Wireshark will stop capturing when one of the attachment points (interfaces) attached to a capture point stops working. For example, if the device that is associated with an attachment point is unplugged from the switch. To resume capturing, the capture must be restarted manually.
- CPU-injected packets are considered control plane packets. Therefore, these types of packets will not be captured on an interface egress capture.
- MAC ACL is only used for non-IP packets such as ARP. It will not be supported on a Layer 3 port or SVI.
- IPv6-based ACLs are not supported in VACL.

- Layer 2 and Layer 3 EtherChannels are not supported.
- ACL logging and Wireshark are incompatible. Once Wireshark is activated, it takes priority. All traffic, including that being captured by ACL logging on any ports, will be redirected to Wireshark. We recommended that you deactivate ACL logging before starting Wireshark. Otherwise, Wireshark traffic will be contaminated by ACL logging traffic.
- Wireshark does not capture packets dropped by floodblock.
- If you capture both PACL and RACL on the same port, only one copy is sent to the CPU. If you capture a DTLS-encrypted CAPWAP interface, two copies are sent to Wireshark, one encrypted and the other decrypted. The same behavior will occur if we capture a Layer 2 interface carrying DTLS-encrypted CAPWAP traffic. The core filter is based on the outer CAPWAP header.

## Information About Wireshark

## Wireshark Overview

Wireshark is a packet analyzer program, formerly known as Ethereal, that supports multiple protocols and presents information in a text-based user interface.

The ability to capture and analyze traffic provides data on network activity. Prior to Cisco IOS Release XE 3.3.0(SE), only two features addressed this need: SPAN and debug platform packet. Both have limitations. SPAN is ideal for capturing packets, but can only deliver them by forwarding them to some specified local or remote destination; it provides no local display or analysis support. The **debug platform packet** command is specific to the Catalyst 4500 series and only works on packets that come from the software process-forwarding path. Also, the **debug platform packet** command has limited local display capabilities and no analysis support.

So the need exists for a traffic capture and analysis mechanism that is applicable to both hardware and software forwarded traffic and that provides strong packet capture, display, and analysis support, preferably using a well known interface.

Wireshark dumps packets to a file using a well known format called .pcap, and is applied or enabled on individual interfaces. You specify an interface in EXEC mode along with the filter and other parameters. The Wireshark application is applied only when you enter a **start** command, and is removed only when Wireshark stops capturing packets either automatically or manually.

## **Capture Points**

A capture point is the central policy definition of the Wireshark feature. The capture point describes all of the characteristics associated with a given instance of Wireshark: which packets to capture, where to capture them from, what to do with the captured packets, and when to stop. Capture points can be modified after creation, and do not become active until explicitly activated with a **start** command. This process is termed activating the capture point or starting the capture point. Capture points are identified by name and can also be manually or automatically deactivated or stopped.

Multiple capture points can be defined, but only one can be active at a time. You need to stop one before you can start the other.

### **Attachment Points**

An attachment point is a point in the logical packet process path associated with a capture point. An attachment point is an attribute of the capture point. Packets that impact an attachment point are tested against capture point filters; packets that match are copied and sent to the associated Wireshark instance of the capture point. A specific capture point can be associated with multiple attachment points, with limits on mixing attachment points of different types. Some restrictions apply when you specify attachment points of different types. Attachment points are directional (input or output or both) with the exception of the Layer 2 VLAN attachment point, which is always bidirectional.

### **Filters**

Filters are attributes of a capture point that identify and limit the subset of traffic traveling through the attachment point of a capture point, which is copied and passed to Wireshark. To be displayed by Wireshark, a packet must pass through an attachment point, as well as all of the filters associated with the capture point.

A capture point has the following types of filters:

- Core system filter—The core system filter is applied by hardware, and its match criteria is limited by hardware. This filter determines whether hardware-forwarded traffic is copied to software for Wireshark purposes.
- Display filter—The display filter is applied by Wireshark. Packets that fail the display filter are not displayed.

#### **Core System Filter**

You can specify core system filter match criteria by using the class map or ACL, or explicitly by using the CLI.

When specifying CAPWAP as an attachment point, the core system filter is not used.

In some installations, you need to obtain authorization to modify the switch configuration, which can lead to extended delays if the approval process is lengthy. This can limit the ability of network administrators to monitor and analyze traffic. To address this situation, Wireshark supports explicit specification of core system filter match criteria from the EXEC mode CLI. The disadvantage is that the match criteria that you can specify is a limited subset of what class map supports, such as MAC, IP source and destination addresses, ether-type, IP protocol, and TCP/UDP source and destination ports.

If you prefer to use configuration mode, you can define ACLs or have class maps refer capture points to them. Explicit and ACL-based match criteria are used internally to construct class maps and policy maps.

Note The ACL and class map configuration are part of the system and not aspects of the Wireshark feature.

#### **Display Filter**

With the display filter, you can direct Wireshark to further narrow the set of packets to display when decoding and displaying from a .pcap file.

#### **Related Topics**

Additional References, on page 35

## **Actions**

Wireshark can be invoked on live traffic or on a previously existing .pcap file. When invoked on live traffic, it can perform four types of actions on packets that pass its display filters:

- Captures to buffer in memory to decode and analyze and store
- Stores to a .pcap file
- Decodes and displays
- Stores and displays

When invoked on a .pcap file only, only the decode and display action is applicable.

## Storage of Captured Packets to Buffer in Memory

Packets can be stored in the capture buffer in memory for subsequent decode, analysis, or storage to a .pcap file.

The capture buffer can be in linear or circular mode. In linear mode, new packets are discarded when the buffer is full. In circular mode, if the buffer is full, the oldest packets are discarded to accommodate the new packets. Although the buffer can also be cleared when needed, this mode is mainly used for debugging network traffic.

Note

If you have more than one capture that is storing packets in a buffer, clear the buffer before starting a new capture to avoid memory loss.

## Storage of Captured Packets to a .pcap File

Note

When WireShark is used on switches in a stack, packet captures can be stored only on flash or USB flash devices connected to the active switch.

For example, if flash1 is connected to the active switch, and flash2 is connected to the secondary switch, only flash1 can be used to store packet captures.

Attempts to store packet captures on devices other than flash or USB flash devices connected to the active switch will probably result in errors.

Wireshark can store captured packets to a .pcap file. The capture file can be located on the following storage devices:

- Switch on-board flash storage (flash:)
- USB drive (usbflash0:)

Attempts to store packet captures on unsupported devices or devices not connected to the active switch will probably result in errors.

When configuring a Wireshark capture point, you can associate a filename. When the capture point is activated, Wireshark creates a file with the specified name and writes packets to it. If the file already exists when the file is associated or the capture point is activated, Wireshark queries you as to whether the file can be overwritten. Only one capture point may be associated with a given filename.

If the destination of the Wireshark writing process is full, Wireshark fails with partial data in the file. You must ensure that there is sufficient space in the file system before you start the capture session. With Cisco IOS Release IOS XE 3.3.0(SE), the file system full status is not detected for some storage devices.

You can reduce the required storage space by retaining only a segment, instead of the entire packet. Typically, you do not require details beyond the first 64 or 128 bytes. The default behavior is to store the entire packet.

To avoid possible packet drops when processing and writing to the file system, Wireshark can optionally use a memory buffer to temporarily hold packets as they arrive. Memory buffer size can be specified when the capture point is associated with a .pcap file.

## **Packet Decoding and Display**

Wireshark can decode and display packets to the console. This functionality is possible for capture points applied to live traffic and for capture points applied to a previously existing pcap file.

Note

Decoding and displaying packets may be CPU intensive.

Wireshark can decode and display packet details for a wide variety of packet formats. The details are displayed by entering the monitor capture name start command with one of the following keyword options, which place you into a display and decode mode:

- brief—Displays one line per packet (the default).
- detailed—Decodes and displays all the fields of all the packets whose protocols are supported. Detailed modes require more CPU than the other two modes.
- (hexadecimal) dump—Displays one line per packet as a hexadecimal dump of the packet data and the printable characters of each packet.

When you enter the **capture** command with the decode and display option, the Wireshark output is returned to Cisco IOS and displayed on the console unchanged.

#### **Live Traffic Display**

Wireshark receives copies of packets from the core system. Wireshark applies its display filters to discard uninteresting packets, and then decodes and displays the remaining packets.

#### .pcap File Display

Wireshark can decode and display packets from a previously stored pcap file and direct the display filter to selectively displayed packets.

## **Packet Storage and Display**

Functionally, this mode is a combination of the previous two modes. Wireshark stores packets in the specified pcap file and decodes and displays them to the console. Only the core filters are applicable here.

## **Wireshark Capture Point Activation and Deactivation**

After a Wireshark capture point has been defined with its attachment points, filters, actions, and other options, it must be activated. Until the capture point is activated, it does not actually capture packets.

Before a capture point is activated, some functional checks are performed. A capture point cannot be activated if it has neither a core system filter nor attachment points defined. Attempting to activate a capture point that does not meet these requirements generates an error.\*

\*When performing a wireless capture with a CAPWAP tunneling interface, the core system filter is not required and cannot be used.

The display filters are specified as needed.

After Wireshark capture points are activated, they can be deactivated in multiple ways. A capture point that is storing only packets to a .pcap file can be halted manually or configured with time or packet limits, after which the capture point halts automatically.

When a Wireshark capture point is activated, a fixed rate policer is applied automatically in the hardware so that the CPU is not flooded with Wireshark-directed packets. The disadvantage of the rate policer is that you cannot capture contiguous packets beyond the established rate even if more resources are available.

## **Wireshark Features**

This section describes how Wireshark features function in the switch environment:

- If port security and Wireshark are applied on an ingress capture, a packet that is dropped by port security will still be captured by Wireshark. If port security is applied on an ingress capture, and Wireshark is applied on an egress capture, a packet that is dropped by port security will not be captured by Wireshark.
- Packets dropped by Dynamic ARP Inspection (DAI) are not captured by Wireshark.
- If a port that is in STP blocked state is used as an attachment point and the core filter is matched, Wireshark will capture the packets that come into the port, even though the packets will be dropped by the switch.
- Classification-based security features—Packets that are dropped by input classification-based security features (such as ACLs and IPSG) are not caught by Wireshark capture points that are connected to attachment points at the same layer. In contrast, packets that are dropped by output classification-based security features are caught by Wireshark capture points that are connected to attachment points at the same layer. The logical model is that the Wireshark attachment point occurs after the security feature lookup on the input side, and symmetrically before the security feature lookup on the output side.

On ingress, a packet goes through a Layer 2 port, a VLAN, and a Layer 3 port/SVI. On egress, the packet goes through a Layer 3 port/SVI, a VLAN, and a Layer 2 port. If the attachment point is before the point where the packet is dropped, Wireshark will capture the packet. Otherwise, Wireshark will not capture

the packet. For example, Wireshark capture policies connected to Layer 2 attachment points in the input direction capture packets dropped by Layer 3 classification-based security features. Symmetrically, Wireshark capture policies attached to Layer 3 attachment points in the output direction capture packets dropped by Layer 2 classification-based security features.

- Routed ports and switch virtual interfaces (SVIs)—Wireshark cannot capture the output of an SVI because the packets that go out of an SVI's output are generated by CPU. To capture these packets, include the control plane as an attachment point.
- VLANs—When a VLAN is used as a Wireshark attachment point, packets are captured in the input direction only.
- Redirection features—In the input direction, features traffic redirected by Layer 3 (such as PBR and WCCP) are logically later than Layer 3 Wireshark attachment points. Wireshark captures these packets even though they might later be redirected out another Layer 3 interface. Symmetrically, output features redirected by Layer 3 (such as egress WCCP) are logically prior to Layer 3 Wireshark attachment points, and Wireshark will not capture them.
- SPAN—Wireshark and SPAN sources are compatible. You can configure an interface as a SPAN source and as a Wireshark attachment point simultaneously. Configuring a SPAN destination port as a Wireshark attachment point is not supported.
- You can capture packets from a maximum of 1000 VLANs at a time, if no ACLs are applied. If ACLs
  are applied, the hardware will have less space for Wireshark to use. As a result, the maximum number
  of VLANs than can be used for packet capture at a time will be lower. Using more than 1000 VLANs
  tunnels at a time or extensive ACLs might have unpredictable results. For example, mobility may go
  down.

Note

Capturing an excessive number of attachment points at the same time is strongly discouraged because it may cause excessive CPU utilization and unpredictable hardware behavior.

#### **Wireless Packet Capture in Wireshark**

- Wireless traffic is encapsulated inside CAPWAP packets. However, capturing only a particular wireless
  client's traffic inside a CAPWAP tunnel is not supported when using the CAPWAP tunnel as an attachment
  point. To capture only a particular wireless client's traffic, use the client VLAN as an attachment point
  and formulate the core filter accordingly.
- Limited decoding of inner wireless traffic is supported. Decoding of inner wireless packets inside encrypted CAPWAP tunnels is not supported.
- No other interface type can be used with the CAPWAP tunneling interface on the same capture point.
   A CAPWAP tunneling interface and a Level 2 port cannot be attachment points on the same capture point.
- You cannot specify a core filter when capturing packets for Wireshark via the CAPWAP tunnel. However, you can use the Wireshark display filters for filtering wireless client traffic against a specific wireless client.
- You can capture packets from a maximum of 135 CAPWAP tunnels at a time if no ACLs are applied.
   If ACLs are applied, the hardware memory will have less space for Wireshark to use. As a result, the maximum number of CAPWAP tunnels than can be used for packet capture at a time will be lower.

Using more than 135 CAPWAP tunnels at a time or unsing extensive ACLs might have unpredictable results. For example, mobility may go down.

Note

Capturing an excessive number of attachment points at the same time is strongly discouraged because it may cause excessive CPU utilization and unpredictable hardware behavior.

### **Guidelines for Wireshark**

- During Wireshark packet capture, hardware forwarding happens concurrently.
- Before starting a Wireshark capture process, ensure that CPU usage is moderate and that sufficient memory (at least 200 MB) is available.
- If you plan to store packets to a storage file, ensure that sufficient space is available before beginning a Wireshark capture process.
- The CPU usage during Wireshark capture depends on how many packets match the specified conditions and on the intended actions for the matched packets (store, decode and display, or both).
- Where possible, keep the capture to the minimum (limit by packets, duration) to avoid high CPU usage and other undesirable conditions.
- Because packet forwarding typically occurs in hardware, packets are not copied to the CPU for software processing. For Wireshark packet capture, packets are copied and delivered to the CPU, which causes an increase in CPU usage.

To avoid high CPU usage, do the following:

- Attach only relevant ports.
- Use a class map, and secondarily, an access list to express match conditions. If neither is viable, use an explicit, in-line filter.
- Adhere closely to the filter rules. Restrict the traffic type (such as, IPv4 only) with a restrictive, rather than relaxed ACL, which elicits unwanted traffic.
- Always limit packet capture to either a shorter duration or a smaller packet number. The parameters of the capture command enable you to specify the following:
  - · Capture duration
  - Number of packets captured
  - File size
  - · Packet segment size
- Run a capture session without limits if you know that very little traffic matches the core filter.
- You might experience high CPU (or memory) usage if:
  - You leave a capture session enabled and unattended for a long period of time, resulting in unanticipated bursts of traffic.

- You launch a capture session with ring files or capture buffer and leave it unattended for a long time, resulting in performance or system health issues.
- During a capture session, watch for high CPU usage and memory consumption due to Wireshark that may impact switch performance or health. If these situations arise, stop the Wireshark session immediately.
- Avoid decoding and displaying packets from a .pcap file for a large file. Instead, transfer the .pcap file to a PC and run Wireshark on the PC.
- You can define up to eight Wireshark instances. An active show command that decodes and displays
  packets from a .pcap file or capture buffer counts as one instance. However, only one of the instances
  can be active.
- Whenever an ACL that is associated with a running capture is modified, you must restart the capture for the ACL modifications to take effect. If you do not restart the capture, it will continue to use the original ACL as if it had not been modified.
- To avoid packet loss, consider the following:
  - Use store-only (when you do not specify the display option) while capturing live packets rather than decode and display, which is an CPU-intensive operation (especially in detailed mode).
  - If you have more than one capture that is storing packets in a buffer, clear the buffer before starting a new capture to avoid memory loss.
  - If you use the default buffer size and see that you are losing packets, you can increase the buffer size to avoid losing packets.
  - Writing to flash disk is a CPU-intensive operation, so if the capture rate is insufficient, you may want to use a buffer capture.
  - The Wireshark capture session operates normally in streaming mode where packets are both captured and processed. However, when you specify a buffer size of at least 32 MB, the session automatically turns on lock-step mode in which a Wireshark capture session is split into two phases: capture and process. In the capture phase, the packets are stored in the temporary buffer. The duration parameter in lock-step mode serves as capture duration rather than session duration. When the buffer is full or the capture duration or packet limit has been attained, a session transitions to the process phase, wherein it stops accepting packets and starts processing packets in the buffer. You can also stop the capture manually. You will see a message in the output when the capture stops. With this second approach (lock-step mode), a higher capture throughput can be achieved.

Note

If you are capturing packets to a buffer, there is no file storage defined. Hence, you must export your capture from the buffer to a static storage file. Use the **monitor capture** *capture-name* **export** *file-location* : *file-name* command.

- <sup>o</sup> The streaming capture mode supports approximately 1000 pps; lock-step mode supports approximately 2 Mbps (measured with 256-byte packets). When the matching traffic rate exceeds this number, you may experience packet loss.
- If you want to decode and display live packets in the console window, ensure that the Wireshark session is bounded by a short capture duration.

Note

Warning: A Wireshark session with either a longer duration limit or no capture duration (using a terminal with no auto-more support using the **term len 0** command) may make the console or terminal unusable.

- When using Wireshark to capture live traffic that leads to high CPU, usage, consider applying a QoS policy temporarily to limit the actual traffic until the capture process concludes.
- All Wireshark-related commands are in EXEC mode; no configuration commands exist for Wireshark.
   If you need to use access list or class-map in the Wireshark CLI, you must define an access list and class map with configuration commands.
- No specific order applies when defining a capture point; you can define capture point parameters in any order, provided that CLI allows this. The Wireshark CLI allows as many parameters as possible on a single line. This limits the number of commands required to define a capture point.
- All parameters except attachment points take a single value. Generally, you can replace the value with a new one by reentering the command. After user confirmation, the system accepts the new value and overrides the older one. A **no** form of the command is unnecessary to provide a new value, but it is necessary to remove a parameter.
- Wireshark allows you to specify one or more attachment points. To add more than one attachment point, reenter the command with the new attachment point. To remove an attachment point, use the **no** form of the command. You can specify an interface range as an attachment point. For example, enter **monitor** capture mycap interface GigabitEthernet1/0/1 in where interface GigabitEthernet1/0/1 is an attachment point.

If you also need to attach interface GigabitEthernet1/0/2, specify it in another line as follows:

#### monitor capture mycap interface GigabitEthernet1/0/2 in

- You can modify any of the parameters of a capture point while a session is active, but you must restart the session for the modifications to take effect.
- The action you want to perform determines which parameters are mandatory. The Wireshark CLI allows you to specify or modify any parameter prior to entering the **start** command. When you enter the **start** command, Wireshark will start only after determining that all mandatory parameters have been provided.
- If the capture file already exists, it provides a warning and receives confirmation before proceeding. This prevents you from mistakenly overwriting a file.
- The core filter can be an explicit filter, access list, or class map. Specifying a newer filter of these types replaces the existing one.

Note

A core filter is required except when using a CAPWAP tunnel interface as a capture point attachment point.

• You can terminate a Wireshark session with an explicit **stop** command or by entering **q** in automore mode. The session could terminate itself automatically when a stop condition such as duration or packet capture limit is met.

## **Default Wireshark Configuration**

The table below shows the default Wireshark configuration.

Feature	Default Setting
Duration	No limit
Packets	No limit
Packet-length	No limit (full packet)
File size	No limit
Ring file storage	No
Buffer storage mode	Linear

# **How to Configure Wireshark**

To configure Wireshark, perform these basic steps.

- 1 Define a capture point.
- 2 (Optional) Add or modify the capture point's parameters.
- 3 Activate or deactivate a capture point.
- 4 Delete the capture point when you are no longer using it.

## **Defining a Capture Point**

The example in this procedure defines a very simple capture point. If you choose, you can define a capture point and all of its parameters with one instance of the **monitor capture** command.

Note

You must define an attachment point, direction of capture, and core filter to have a functional capture point.

An exception to needing to define a core filter is when you are defining a wireless capture point using a CAPWAP tunneling interface. In this case, you do not define your core filter. It cannot be used.

In privileged EXEC mode, follow these steps to define a capture point.

#### **SUMMARY STEPS**

- 1. show capwap summary
- 2. monitor capture {capture-name} {interface interface-type interface-id | control-plane} {in | out | both}
- 3. monitor capture {capture-name} [match {any | ipv4 any any | ipv6} any any}]
- 4. show monitor capture {capture-name}[ parameter]

#### **DETAILED STEPS**

	Command or Action	Purpose	
Step 1	show capwap summary	Displays the CAPWAP tunnels available as attachment points for a wireless capture.	
	Example: Switch# show capwap summary	Note Use this command only if you are using a CAPWAP tunnel as an attachment point to perform a wireless capture. See the CAPWAP example in the examples section.	
Step 2	monitor capture {capture-name} {interface interface-type interface-id   control-plane} {in   out   both}	Defines the capture point, specifies the attachment point with which the capture point is associated, and specifies the direction of the capture.  The keywords have these meanings:	
	Example:	• <i>capture-name</i> —Specifies the name of the capture point to be defined (mycap is used in the example).	
	Switch# monitor capture mycap interface GigabitEthernet1/0/1 in	• (Optional) <b>interface</b> <i>interface-type interface-id</i> —Specifies the attachment point with which the capture point is associated (GigabitEthernet1/0/1 is used in the example).	
		Note Optionally, you can define multiple attachment points and all of the parameters for this capture point with this one command instance. These parameters are discussed in the instructions for modifying capture point parameters. Range support is also available both for adding and removing attachment points.	
		Use one of the following for interface-type:	
		° GigabitEthernet—Specifies the attachment point as GigabitEthernet.	
		° vlan—Specifies the attachment point as a VLAN.	
		Note Only ingress capture (in) is allowed when using this interface as an attachment point.	
		° capwap—Specifies the attachment point as a CAPWAP tunnel.	

	Command or Action	Purpose	
		Note When using this interface as an attachment point, a core filter cannot be used.	
		• (Optional) <b>control-plane</b> —Specifies the control plane as an attachment point.	
		• in   out   both—Specifies the direction of capture.	
Step 3	monitor capture	Defines the core system filter.	
	{capture-name}[match {any   ipv4 any any   ipv6} any any}]	<b>Note</b> When using the CAPWAP tunneling interface as an attachment point, do not perform this step because a core filter cannot be used.	
	Example:	The keywords have these meanings:	
	Switch# monitor capture mycap interface GigabitEthernet1/0/1 in match any	• <i>capture-name</i> —Specifies the name of the capture point to be defined (mycap is used in the example).	
		• match—Specifies a filter. The first filter defined is the core filter.	
		Note A capture point cannot be activated if it has neither a core system filter nor attachment points defined. Attempting to activate a capture point that does not meet these requirements generates an error.	
		• ipv4—Specifies an IP version 4 filter.	
		• ipv6—Specifies an IP version 6 filter.	
Step 4	show monitor capture {capture-name}[ parameter]	Displays the capture point parameters that you defined in Step 1 and confirms that you defined a capture point.	
	Example: Switch# show monitor capture mycap parameter monitor capture mycap interface GigabitEthernet1/0/1 in monitor capture mycap match any		

#### To define a capture point with a CAPWAP attachment point:

#### Switch# show capwap summary

You can add additional attachment points, modify the parameters of your capture point, then activate it, or if you want to use your capture point just as it is, you can now activate it.

You cannot change a capture point's parameters using the methods presented in this topic.

## **Adding or Modifying Capture Point Parameters**

Although listed in sequence, the steps to specify values for the parameters can be executed in any order. You can also specify them in one, two, or several lines. Except for attachment points, which can be multiple, you can replace any value with a more recent value by redefining the same option.

In privileged EXEC mode, follow these steps to modify a capture point's parameters.

#### **Before You Begin**

A capture point must be defined before you can use these instructions.

#### **SUMMARY STEPS**

- 1. monitor capture {capture-name} match {any | mac mac-match-string | ipv4 {any | host | protocol} {any | host} | ipv6 {any | host | protocol} {any | host}}
- 2. monitor capture {capture-name} limit {[duration seconds][packet-length size][packets num]}
- **3.** monitor capture {capture-name} file {location filename}
- **4.** monitor capture {capture-name} file {buffer-size size}
- 5. show monitor capture {capture-name}[ parameter]

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	monitor capture {capture-name} match {any   mac mac-match-string   ipv4 {any   host   protocol} {any   host}	Defines the core system filter (ipv4 any any), defined either explicitly, through ACL or through a class map.
	<pre>ipv6 {any   host   protocol} {any   host}}</pre> Example: Switch# monitor capture mycap match ipv4 any any	Note If you are defining a wireless capture point using a CAPWAP tunneling interface, this command will have no effect, so it should not be used.
Step 2	monitor capture {capture-name} limit {[duration seconds][packet-length size][packets num]}	Specifies the session limit in seconds (60), packets captured, or the packet segment length to be retained by Wireshark (400).
	Example: Switch# monitor capture mycap limit duration 60 packet-len 400	
Step 3	monitor capture {capture-name} file {location filename}	Specifies the file association, if the capture point intends to capture packets rather than only display
	Example: Switch# monitor capture mycap file location flash:mycap.pcap	them.
Step 4	monitor capture {capture-name} file {buffer-size size}	Specifies the size of the memory buffer used by Wireshark to handle traffic bursts.
	Example: Switch# monitor capture mycap file buffer-size 100	
Step 5	show monitor capture {capture-name}[ parameter]	Displays the capture point parameters that you defined previously.
	Example:	
	Switch# show monitor capture mycap parameter monitor capture mycap interface GigabitEthernet1/0/1 in monitor capture mycap match ipv4 any any monitor capture mycap limit duration 60 packet-len	
	400 monitor capture point mycap file location bootdisk:mycap.pcap monitor capture mycap file buffer-size 100	

#### **Examples**

#### **Modifying Parameters**

#### Associating or Disassociating a Capture File

 $\label{thm:capture point mycap file location flash:mycap.pcap Switch monitor capture mycap file} Switch monitor capture mycap file$ 

Specifying a Memory Buffer Size for Packet Burst Handling

Switch# monitor capture mycap buffer size 100

Defining an Explicit Core System Filter to Match Both IPv4 and IPv6

Switch# monitor capture mycap match any

if your capture point contains all of the parameters you want, activate it.

## **Deleting Capture Point Parameters**

Although listed in sequence, the steps to delete parameters can be executed in any order. You can also delete them in one, two, or several lines. Except for attachment points, which can be multiple, you can delete any parameter.

In privileged EXEC mode, follow these steps to delete a capture point's parameters.

#### **Before You Begin**

A capture point parameter must be defined before you can use these instructions to delete it.

#### **SUMMARY STEPS**

- 1. no monitor capture {capture-name} match
- 2. no monitor capture {capture-name} limit [duration][packet-length][packets]
- 3. no monitor capture {capture-name} file [location] [buffer-size]
- 4. show monitor capture {capture-name}[ parameter]

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	no monitor capture {capture-name} match	Deletes all filters defined on capture point (mycap).
	Example: Switch# no monitor capture mycap match	
Step 2	no monitor capture {capture-name} limit [duration][packet-length][packets]	Deletes the session time limit and the packet segment length to be retained by Wireshark. It leaves other specified limits in place.
	Example: Switch# no monitor capture mycap limit duration packet-len Switch# no monitor capture mycap limit	Deletes all limits on Wireshark.
Step 3	no monitor capture {capture-name} file [location] [buffer-size]	Deletes the file association. The capture point will no longer capture packets. It will only display them.

	Command or Action	Purpose
	Example: Switch# no monitor capture mycap file Switch# no monitor capture mycap file location	Deletes the file location association. The file location will no longer be associated with the capture point. However, other defined fille association will be unaffected by this action.
Step 4	show monitor capture {capture-name}[ parameter]	Displays the capture point parameters that remain defined after your parameter deletion operations. This command can be run
	Example: Switch# show monitor capture mycap parameter monitor capture mycap interface GigabitEthernet1/0/1 in	at any point in the procedure to see what parameters are associated with a capture point.

If your capture point contains all of the parameters you want, activate it.

## **Deleting a Capture Point**

In privileged EXEC mode, follow these steps to delete a capture point.

#### **Before You Begin**

A capture point must be defined before you can use these instructions to delete it.

#### **SUMMARY STEPS**

- **1. no monitor capture** {capture-name}
- 2. show monitor capture {capture-name}[ parameter]

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	no monitor capture {capture-name}	Deletes the specified capture point (mycap).
	Example: Switch# no monitor capture mycap	

	Command or Action	Purpose
Step 2	<pre>show monitor capture {capture-name}[ parameter]  Example: Switch# show monitor capture mycap parameter Capture mycap does not exist</pre>	Displays a message indicating that the specified capture point does not exist because it has been deleted.

You can define a new capture point with the same name as the one you deleted. These instructions are usually performed when one wants to start over with defining a capture point.

#### **Related Topics**

How to Configure Wireshark, on page 12 Defining a Capture Point, on page 12

Adding or Modifying Capture Point Parameters, on page 16

## **Activating and Deactivating a Capture Point**

In privileged EXEC mode, follow these steps to activate or deactivate a capture point.

#### **Before You Begin**

A capture point cannot be activated unless an attachment point and a core system filter have been defined and the associated filename (if any) does not already exist. A capture point with no associated filename can only be activated to display. If no capture or display filters are specified, all of the packets captured by the core system filter are displayed. The default display mode is brief.

Note

When using a CAPWAP tunneling interface as an attachment point, core filters are not used, so there is no requirement to define them in this case.

#### **SUMMARY STEPS**

- 1. monitor capture {capture-name} start[display [display-filter filter-string]][brief | detailed | dump]
- **2.** monitor capture {capture-name} stop

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	monitor capture {capture-name} start[display [display-filter filter-string]][brief   detailed   dump]	Activates a capture point and filters the display, so only packets containing "stp" are displayed.
	Example: Switch# monitor capture mycap start display display-filter "stp"	
Step 2	monitor capture {capture-name} stop	Deactivates a capture point.
	Example: Switch# monitor capture name stop	

#### **Related Topics**

## **Clearing the Capture Point Buffer**

In privileged EXEC mode, follow these steps to clear the buffer contents or save them to an external file for storage.

Note

If you have more than one capture that is storing packets in a buffer, clear the buffer before starting a new capture to avoid memory loss.

#### **SUMMARY STEPS**

1. monitor capture {capture-name} [clear | export filename]

#### **DETAILED STEPS**

	Command or Action	Purpose
Step 1	monitor capture {capture-name} [clear   export filename]	Clears capture buffer contents or stores the packets to a file.
	Example: Switch# monitor capture mycap clear	

#### **Examples: Capture Point Buffer Handling**

#### **Exporting Capture to a File**

Switch# monitor capture mycap export flash:mycap.pcap

Storage configured as File for this capture

#### **Clearing Capture Point Buffer**

Switch# monitor capture mycap clear

Capture configured with file options

# **Monitoring Wireshark**

The commands in this table are used to monitor Wireshark.

Command	Purpose
show monitor capture [capture-name]	Displays the capture point state so that you can see what capture points are defined, what their attributes are, and whether they are active. When capture point name is specified, it displays specific capture point's details.
show monitor capture [capture-name parameter]	Displays the capture point parameters.
show capwap summary	Displays all the CAPWAP tunnels on the switch. Use this command to determine which CAPWAP tunnels are available to use for a wireless capture.

## **Configuration Examples for Wireshark**

## **Example: Displaying a Brief Output from a .pcap File**

You can display the output from a .pcap file by entering:

Switch# show monitor capture file flash:mycap.pcap

## **Example: Simple Capture and Display**

This example shows how to monitor traffic in the Layer 3 interface Gigabit Ethernet 1/0/1:

**Step 1**: Define a capture point to match on the relevant traffic by entering:

```
Switch# monitor capture mycap interface GigabitEthernet1/0/1 in Switch# monitor capture mycap match ipv4 any any
```

```
Switch# monitor capture mycap limit duration 60 packets 100 Switch# monitor capture mycap buffer size 100
```

To avoid high CPU utilization, a low packet count and duration as limits has been set.

**Step 2**: Confirm that the capture point has been correctly defined by entering:

```
Switch# show monitor capture mycap parameter
  monitor capture mycap interface GigabitEthernet1/0/1 in
  monitor capture mycap match ipv4 any any
   monitor capture mycap buffer size 100
  monitor capture mycap limit packets 100 duration 60
Switch# show monitor capture mycap
Status Information for Capture mycap
 Target Type:
  Interface: GigabitEthernet1/0/1, Direction: in
  Status : Inactive
  Filter Details:
   Source IP: any
   Destination IP:
                     any
  Protocol: any
  Buffer Details:
  Buffer Type: LINEAR (default)
  Buffer Size (in MB): 100
  File Details:
  File not associated
  Limit Details:
  Number of Packets to capture: 100
   Packet Capture duration: 60
   Packet Size to capture: 0 (no limit)
   Packets per second: 0 (no limit)
   Packet sampling rate: 0 (no sampling)
```

#### **Step 3**: Start the capture process and display the results.

```
Switch# monitor capture mycap start display
  0.000000
                                       UDP Source port: 20001 Destination port: 20002
             10.1.1.30 -> 20.1.1.2
                                       UDP Source port: 20001 Destination port: 20002

             10.1.1.37 -> 20.1.1.2
                                       UDP Source port: 20001 Destination port: 20002
  7.000000
             10.1.1.38 -> 20.1.1.2
 8.000000
                                       UDP Source port: 20001 Destination port: 20002
 9.000000
             10.1.1.39 -> 20.1.1.2
                                       UDP Source port: 20001 Destination port: 20002
```

**Step 4**: Delete the capture point by entering:

```
Switch# no monitor capture mycap
```

## **Example: Simple Capture and Store**

This example shows how to capture packets to a filter:

**Step 1**: Define a capture point to match on the relevant traffic and associate it to a file by entering:

```
Switch# monitor capture mycap interface GigabitEthernet1/0/1 in Switch# monitor capture mycap match ipv4 any any Switch# monitor capture mycap limit duration 60 packets 100 Switch# monitor capture mycap file location flash:mycap.pcap
```

Step 2: Confirm that the capture point has been correctly defined by entering:

```
Switch# show monitor capture mycap parameter
monitor capture mycap interface GigabitEthernet1/0/1 in
monitor capture mycap match ipv4 any any
```

```
monitor capture mycap file location flash:mycap.pcap
  monitor capture mycap limit packets 100 duration 60
Switch# show monitor capture mycap
Status Information for Capture mycap
  Target Type:
   Interface: GigabitEthernet1/0/1, Direction: in
   Status: Inactive
  Filter Details:
   T P<sub>17</sub>4
    Source IP: any
   Destination TP:
                     any
  Protocol: anv
  Buffer Details:
   Buffer Type: LINEAR (default)
  File Details:
  Associated file name: flash:mycap.pcap
  Limit Details:
  Number of Packets to capture: 100
   Packet Capture duration: 60
   Packet Size to capture: 0 (no limit)
   Packets per second: 0 (no limit)
   Packet sampling rate: 0 (no sampling)
```

#### Step 3: Launch packet capture by entering:

Switch# monitor capture mycap start

**Step 4**: After sufficient time has passed, stop the capture by entering:

Switch# monitor capture mycap stop

Alternatively, you could allow the capture operation stop automatically after the time has elapsed or the packet count has been met.

The mycap.pcap file now contains the captured packets.

#### Step 5: Display the packets by entering:

Switch# show monitor capture file flash:mycap.pcap

```
0.000000
            10.1.1.30 -> 20.1.1.2

5.000000
            10.1.1.35 -> 20.1.1.2
                                      UDP Source port: 20001
                                                              Destination port: 20002
6.000000
           10.1.1.36 -> 20.1.1.2
                                      UDP Source port: 20001
                                                              Destination port: 20002
7.000000
            10.1.1.37 -> 20.1.1.2
                                      UDP Source port: 20001
                                                              Destination port: 20002
8.000000
            10.1.1.38 -> 20.1.1.2
                                      UDP Source port: 20001
                                                              Destination port: 20002
9.000000
            10.1.1.39 -> 20.1.1.2
                                      UDP Source port: 20001 Destination port: 20002
```

**Step 6**: Delete the capture point by entering:

Switch# no monitor capture mycap

## **Example: Using Buffer Capture**

This example shows how to use buffer capture:

**Step 1**: Launch a capture session with the buffer capture option by entering:

```
Switch# monitor capture mycap interface GigabitEthernet1/0/1 in Switch# monitor capture mycap match ipv4 any any
```

OL-28050-02

#### **Step 2**: Determine whether the capture is active by entering:

#### Switch# show monitor capture mycap

```
Status Information for Capture mycap
 Target Type:
  Interface: GigabitEthernet1/0/1, Direction: in
  Status : Active
  Filter Details:
  IPv4
   Source IP: any
   Destination IP:
  Protocol: any
 Buffer Details:
  Buffer Type: CIRCULAR
  Buffer Size (in MB): 1
 File Details:
  File not associated
 Limit Details:
  Number of Packets to capture: 0 (no limit)
   Packet Capture duration: 0 (no limit)
  Packet Size to capture: 0 (no limit)
   Packets per second: 0 (no limit)
   Packet sampling rate: 0 (no sampling)
```

#### **Step 3**: Display the packets in the buffer by entering:

#### Switch# show monitor capture mycap buffer brief

```
0.000000
            10.1.1.215 -> 20.1.1.2

                                                                 Destination port: 20002
6.000000
             10.1.1.8 -> 20.1.1.2
                                        UDP Source port: 20001
                                                                 Destination port:
                                                                                    20002
7.000000
             10.1.1.9 -> 20.1.1.2
                                       UDP Source port: 20001
                                                                 Destination port: 20002
8.000000
            10.1.1.10 -> 20.1.1.2
                                        UDP Source port: 20001
                                                                 Destination port: 20002
9.000000
            10.1.1.11 -> 20.1.1.2
                                       UDP Source port: 20001
                                                                 Destination port: 20002
```

Step 13: Store the buffer contents to the mycap1 pcap file in the internal flash: storage device by entering:

```
Switch# monitor capture mycap export flash:mycap1.pcap
Exported Successfully
```

**Step 14**: Check that the file has been created and that it contains the packets by entering:

```
Switch# dir flash:mycap1.pcap
Directory of flash:/mycap1.pcap
14758 -rw-
                  20152 Apr 15 2012 16:00:28 -07:00 mycap1.pcap

                                                                Destination port: 20002
               10.1.1.8 -> 20.1.1.2
                                        UDP Source port: 20001
  6.000000
                                                                Destination port: 20002
               10.1.1.9 -> 20.1.1.2
  7.000000
                                        UDP Source port: 20001
                                                                Destination port: 20002
  8.000000
             10.1.1.10 -> 20.1.1.2
                                        UDP Source port: 20001
                                                                Destination port: 20002
              10.1.1.11 -> 20.1.1.2
  9.000000
                                        UDP Source port: 20001
                                                                Destination port: 20002
 10.000000
              10.1.1.12 -> 20.1.1.2
                                        UDP Source port: 20001
                                                                Destination port: 20002
 11.000000
                                        UDP Source port: 20001 Destination port: 20002
              10.1.1.13 -> 20.1.1.2
```

Step 16: Clear the buffer and then try to display packets from the buffer by entering:

```
Switch# monitor capture mycap clear
Switch# show monitor capture mycap buffer brief
```

#### **Step 17**: Delete the capture point by entering:

Switch# monitor capture mycap stop

```
Switch# no monitor capture mycap
```

## **Example: Capture Sessions**

```
Switch# monitor capture mycap start display display-filter "stp"

## **Example: Capture and Store in Lock-step Mode**

This example captures live traffic and stores the packets in lock-step mode.

The capture rate might be slow for the first 15 seconds. If possible and necessary, start the traffic 15 seconds after the capture session starts.

**Step 1**: Define a capture point to match on the relevant traffic and associate it to a file by entering:

```
Switch# monitor capture mycap interface GigabitEthernet1/0/1 in
Switch# monitor capture mycap match ipv4 any any
Switch# monitor capture mycap limit duration 60 packets 100
Switch# monitor capture mycap file location flash:mycap.pcap buffer-size 64
```

**Step 2**: Confirm that the capture point has been correctly defined by entering:

```
Switch# show monitor capture mycap parameter
  monitor capture mycap interface GigabitEthernet1/0/1 in
  monitor capture mycap file location flash:mycap.pcap buffer-size 64
   monitor capture mycap limit packets 100 duration 60
Switch# show monitor capture mycap
Status Information for Capture mycap
 Target Type:
  Interface: GigabitEthernet1/0/1, Direction: in
  Status : Inactive
  Filter Details:
  Filter not attached
  Buffer Details:
  Buffer Type: LINEAR (default)
  File Details:
   Associated file name: flash:mycap.pcap
   Size of buffer(in MB): 64
  Limit Details:
  Number of Packets to capture: 100
   Packet Capture duration: 60
   Packet Size to capture: 0 (no limit)
   Packets per second: 0 (no limit)
   Packet sampling rate: 0 (no sampling)
```

#### **Step 3**: Launch packet capture by entering:

```
Switch# monitor capture mycap start
A file by the same capture file name already exists, overwrite?[confirm]
Turning on lock-step mode
Switch#
*Oct 14 09:35:32.661: %BUFCAP-6-ENABLE: Capture Point mycap enabled.
```

#### **Step 4**: Display the packets by entering:

```
Switch# show monitor capture file flash:mycap.pcap
                                    UDP Source port: 20001 Destination port: 20002
  0.000000
             10.1.1.30 -> 20.1.1.2
  1.000000
             10.1.1.31 -> 20.1.1.2
                                       UDP Source port: 20001 Destination port: 20002
  2.000000
             10.1.1.32 -> 20.1.1.2
                                       UDP Source port: 20001
                                                               Destination port: 20002
  3.000000
             10.1.1.33 -> 20.1.1.2
                                      UDP Source port: 20001 Destination port: 20002
  4.000000
             10.1.1.34 -> 20.1.1.2
                                       UDP Source port: 20001
                                                               Destination port: 20002
             10.1.1.35 -> 20.1.1.2
  5.000000
                                       UDP Source port: 20001
                                                               Destination port: 20002
  6.000000
             10.1.1.36 -> 20.1.1.2
                                      UDP Source port: 20001 Destination port: 20002
  7.000000
             10.1.1.37 -> 20.1.1.2
                                       UDP Source port: 20001
                                                               Destination port: 20002
  8.000000
             10.1.1.38 -> 20.1.1.2
                                       UDP Source port: 20001 Destination port: 20002
  9.000000
             10.1.1.39 -> 20.1.1.2
                                       UDP Source port: 20001 Destination port: 20002
```

**Step 5**: Delete the capture point by entering:

Switch# no monitor capture mycap

## **Example: Simple Capture and Store of Packets in Egress Direction**

This example shows how to capture packets to a filter:

**Step 1**: Define a capture point to match on the relevant traffic and associate it to a file by entering:

```
Switch# monitor capture mycap interface Gigabit 1/0/1 out match ipv4 any any Switch# monitor capture mycap limit duration 60 packets 100
Switch# monitor capture mycap file location flash:mycap.pcap buffer-size 90
```

#### **Step 2**: Confirm that the capture point has been correctly defined by entering:

```
Switch# show monitor capture mycap parameter
   monitor capture mycap interface GigabitEthernet1/0/1 out
   monitor capture mycap match ipv4 any any
   monitor capture mycap file location flash:mycap.pcap buffer-size 90
   monitor capture mycap limit packets 100 duration 60
Switch# show monitor capture mycap
Status Information for Capture mycap
  Target Type:
   Interface: GigabitEthernet1/0/1, Direction: out
   Status : Inactive
  Filter Details:
   IPv4
    Source IP: any
    Destination IP:
   Protocol: any
  Buffer Details:
   Buffer Type: LINEAR (default)
  File Details:
   Associated file name: flash:mycap.pcap
   Size of buffer(in MB): 90
  Limit Details:
   Number of Packets to capture: 100
   Packet Capture duration: 60
   Packet Size to capture: 0 (no limit)
   Packets per second: 0 (no limit)
   Packet sampling rate: 0 (no sampling)
Step 3: Launch packet capture by entering:
Switch# monitor capture mycap start
A file by the same capture file name already exists, overwrite?[confirm]
Turning on lock-step mode
```

\*Oct 14 09:35:32.661: %BUFCAP-6-ENABLE: Capture Point mycap enabled.

Allow the capture operation stop automatically after the time has elapsed or the packet count has been met. When you see the following message in the output, will know that the capture operation has stopped:

```
\star \text{Oct}\ 14\ 09:36:34.632: \\$\text{BUFCAP-6-DISABLE\_ASYNC:} Capture Point mycap disabled. Reason: Wireshark Session Ended
```

The mycap.pcap file now contains the captured packets.

#### **Step 4**: Display the packets by entering:

```
Switch# show monitor capture file flash:mycap.pcap
 0.000000
             10.1.1.30 -> 20.1.1.2
                                        UDP Source port: 20001
                                                               Destination port: 20002
             10.1.1.31 -> 20.1.1.2
 1.000000
                                        UDP Source port: 20001
                                                                Destination port: 20002
 2.000000
             10.1.1.32 -> 20.1.1.2
                                        UDP Source port: 20001 Destination port: 20002
             10.1.1.33 -> 20.1.1.2
  3.000000
                                        UDP Source port: 20001
                                                                Destination port: 20002
             10.1.1.34 -> 20.1.1.2
 4.000000
                                        UDP Source port: 20001 Destination port: 20002
 5.000000
             10.1.1.35 -> 20.1.1.2
                                        UDP Source port: 20001 Destination port: 20002
  6.000000
             10.1.1.36 -> 20.1.1.2
                                        UDP Source port: 20001
                                                                Destination port:
                                                                                  20002
  7.000000
             10.1.1.37 -> 20.1.1.2
                                        UDP Source port: 20001
                                                               Destination port: 20002
 8.000000
             10.1.1.38 -> 20.1.1.2
                                        UDP Source port: 20001
                                                                Destination port: 20002
             10.1.1.39 -> 20.1.1.2
 9.000000
                                        UDP Source port: 20001 Destination port: 20002
```

**Step 5**: Delete the capture point by entering:

Switch# no monitor capture mycap
