Preface

- [Audience, page vii](#)
- [Document Organization, page vii](#)
- [Related Documentation, page vii](#)
- [Documentation Feedback, page viii](#)

Audience

This guide is intended for software engineers with a background in programming and the use of APIs. Engineers should have knowledge of XML, data systems, networking protocols, and storage protocols.

Document Organization

This XML API Reference Guide is organized into the following chapters:

- [Cisco IMC XML API, on page 1](#)
- [Using the Cisco IMC XML API Methods, on page 9](#)
- [Cisco IMC XML API Method Descriptions, on page 15](#)
- [Cisco IMC XML Object-Access Privileges, on page 35](#)

Related Documentation

For a complete list of all C-Series documentation, see the *Cisco UCS C-Series Servers Documentation Roadmap* available at the following URL: <http://www.cisco.com/go/unifiedcomputing/c-series-doc>.

Note

The *Cisco UCS C-Series Servers Integrated Management Controller GUI Configuration Guide* and the *Cisco UCS C-Series Servers Integrated Management Controller CLI Command Reference* provide an overview of Cisco IMC. This is important background information for XML API software developers.

Documentation Feedback

To provide technical feedback on this document, or to report an error or omission, please send your comments to ucs-docfeedback@cisco.com. We appreciate your feedback.

CHAPTER 1

Cisco IMC XML API

This chapter includes the following sections:

- [About the Cisco IMC XML API, page 1](#)
- [Cisco UCS Management Information Model, page 2](#)
- [Cisco IMC XML API Sample Flow, page 2](#)
- [Object Naming, page 3](#)
- [API Method Categories, page 4](#)
- [Success or Failure Response, page 6](#)

About the Cisco IMC XML API

The Cisco IMC XML API is a programmatic interface to the Cisco Integrated Management Controller (Cisco IMC) software for a C-Series Rack-Mount Server. The API accepts XML documents through HTTP or HTTPS. Developers can use any programming language to generate XML documents that contain the API methods. Configuration and state information for Cisco IMC is stored in a hierarchical tree structure known as the MIT (Management Information Tree), which is completely accessible through the XML API.

The Cisco IMC XML API implements a subset of the methods and management information model available in the Cisco UCS Manager XML API. The behavior of both APIs is similar in syntax and semantics, and you can use the same client development tools and techniques for both. The scope of the Cisco IMC XML API is limited to a single C-Series Rack-Mount Server, in contrast to the Cisco UCS Manager XML API, which controls an entire Cisco UCS domain consisting of switches, FEX modules, servers, and other devices.

Using the Cisco IMC XML API, the user has programmatic access to Cisco IMC to configure, administer, and monitor the server. The API provides most of the functions that are accessible through the Cisco IMC CLI and GUI interfaces.

Operation of the API is transactional and terminates on a single data model maintained in Cisco IMC.

The API model includes the following programmatic entities:

- Classes—Define the properties and states of objects in the MIT.
- Methods—Actions that the API performs on one or more objects.

- Types—Object properties that map values to the object state (for example, `equipmentPresence`).

A typical request comes into Cisco IMC and is placed in the transactor queue in FIFO order. The transactor gets the request from the queue, interprets the request, and performs an authorization check. After the request is confirmed, the transactor updates the MIT. This complete operation is done in a single transaction.

Event subscription is supported. Up to four Cisco IMC XML API clients can subscribe to receive event notifications from Cisco IMC. The event subscription operation establishes a connection session allowing a client to receive XML-formatted event notification messages that are sent asynchronously by Cisco IMC.

Note In Release 1.5(1.x), the Cisco IMC XML API sends event notifications only for fault-related events.

Cisco UCS Management Information Model

All the physical and logical components that comprise Cisco UCS are represented in a hierarchical management information model (MIM), also referred to as the MIT. Each node in the tree represents a managed object (MO) or group of objects that contains its administrative state and its operational state.

The hierarchical structure starts at the top (`sys`) and contains parent and child nodes. Each node in this tree is a managed object and each object in Cisco UCS has a unique distinguished name (DN) that describes the object and its place in the tree. Managed objects are abstractions of the Cisco UCS resources, such as CPUs, DIMMs, adapter cards, fans, and power supply units..

Configuration policies are the majority of the policies in the system and describe the configurations of different Cisco UCS components. Policies determine how the system behaves under specific circumstances. Certain managed objects are not created by users, but are automatically created by the Cisco UCS, for example, power supply objects and fan objects. By invoking the API, you are reading and writing objects to the MIM.

Cisco IMC Management Information Model

The Cisco IMC management information model is a subset of the Cisco UCS management information model. A C-Series Rack-Mount Server is modeled starting with `sys/rack-unit-1` in the MIT as in the following example:

Figure 1: Illustration of the CIMC MIM Structure

```
Tree (topRoot):-----Distinguished Name:
|---sys-----(sys)
|   |---rack-unit-1---(sys/rack-unit-1)
|   |   |---adaptor-1---(sys/rack-unit-1/adaptor-1)
|   |   |---psu-1-----(sys/rack-unit-1/psu-1)
|   |   |---psu-2-----(sys/rack-unit-1/psu-2)
```

Cisco IMC XML API Sample Flow

A typical request comes into Cisco IMC and is placed in the transactor queue in FIFO order. The transactor gets the request from the queue, interprets the request, and performs an authorization check. After the request

is confirmed, the transactor updates the management information tree. This operation is done in a single transaction.

The following figure shows how Cisco IMC processes a boot server request. The following table describes the steps involved in a boot server request.

Figure 2: Sample Flow of Boot Server Request

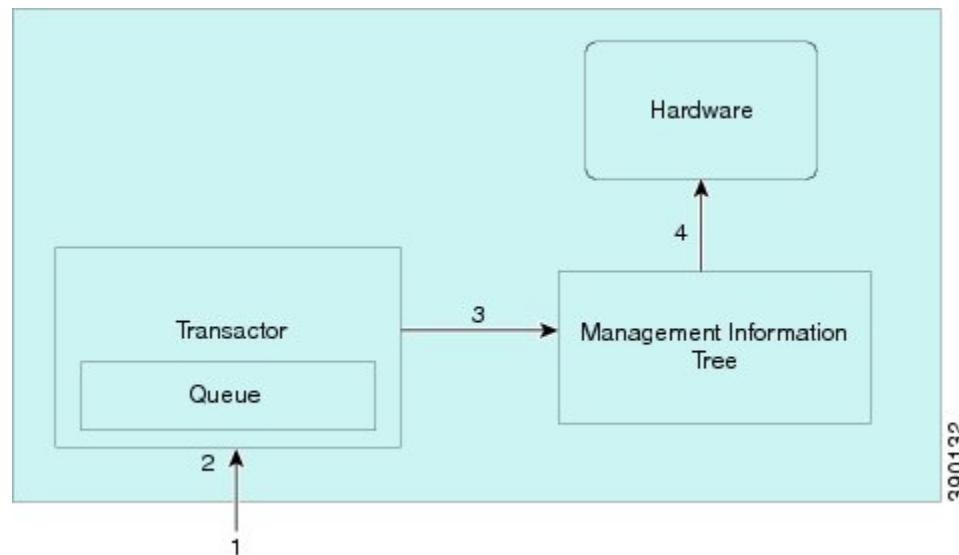

Table 1: Explanation of Boot Server Request

Step	Command/Process	Operational Power State of MO (Server)
1	CMD request: boot server	Down
2	Request queued	Down
3	State change in management information tree and make persistent the managed object (MO) state change	Down
4	Apply boot stimuli	Up

Object Naming

You can identify a specific object by its distinguished name (DN) or by its relative name (RN).

Distinguished Name

The distinguished name enables you to unambiguously identify a target object. The distinguished name has the following format consisting of a series of relative names:

```
dn = {rn}/{rn}/{rn}/{rn}...
```

In the following example, the DN provides a fully qualified path for `adaptor-1` from the top of the object tree to the object. The DN specifies the exact managed object on which the API call is operating.

```
< dn ="sys/rack-unit-1//adaptor-1"/>
```

Relative Name

The relative name identifies an object within the context of its parent object. The distinguished name is composed of a sequence of relative names.

For example, this distinguished name:

```
<dn = "sys/rack-unit-1//adaptor-1/host-eth-2"/>
```

is composed of the following relative names:

```
topSystem MO: rn="sys"
computeRackUnit MO: rn ="rack-unit-1"
adaptorUnit MO: rn="adaptor-<id>"
adaptorHostEthIf MO: rn="host-eth-<id>"
```

API Method Categories

Each method corresponds to an XML document.

Note

Several code examples in this guide substitute the term `<real_cookie>` for an actual cookie (such as 1217377205/85f7ff49-e4ec-42fc-9437-da77a1a2c4bf). The XML API cookie is a 47-character string; it is not the type of cookie that web browsers store locally to maintain session information.

Authentication Methods

Authentication methods authenticate and maintain the session. For example:

- `aaaLogin`—Initial method for logging in.
- `aaaRefresh`—Refreshes the current authentication cookie.
- `aaaLogout`—Exits the current session and deactivates the corresponding authentication cookie.

Use the `aaaLogin` method to get a valid cookie. Use `aaaRefresh` to maintain the session and keep the cookie active. Use the `aaaLogout` method to terminate the session (also invalidates the cookie). A maximum of 4 sessions to the Cisco UCS can be opened at any one time.

Operations are performed using the HTTP post method (Cisco IMC supports both HTTP and HTTPS requests) over TCP. HTTP and HTTPS can be configured to use different port numbers, but TCP/443 (or TCP/80 for non-secure connections) is used by default. The HTTP envelope contains the XML configuration.

**Tip**

In Cisco IMC, HTTP to HTTPS redirection is enabled by default. To capture HTTP packets between the client application and Cisco IMC, disable redirection in the Cisco IMC GUI or CLI.

Query Methods

Query methods obtain information on the current configuration state of an object. The following are query methods supported:

- configResolveDn—Retrieves objects by DN.
- configResolveClass—Retrieves objects of a given class.
- configResolveChildren—Retrieves the child objects of an object.
- configResolveParent—Retrieves the parent object of an object.

Most query methods have the argument inHierarchical (Boolean true/yes or false/no). If true, the inHierarchical argument returns all child objects.

```
<configResolveDn ... inHierarchical="false"></>
<configResolveDn ... inHierarchical="true"></>
```

Because the amount of data returned from Cisco IMC can be quite large, the inHierarchical argument should be used with care. For example, if the query method is used on a class or DN that refers to a managed object (MO) that is located high on the management information tree and inHierarchical is set to true, the response can contain almost the entire Cisco IMC configuration. The resources required for Cisco IMC to process the request can be high, causing Cisco IMC to take an extended amount of time to respond. To avoid delays, the query method should be performed on a smaller scale involving fewer MOs.

**Tip**

If a query method does not respond or is taking a long time to respond, increase the timeout period on the client application or adjust the query method to involve fewer MOs.

The query API methods might also have an inRecursive argument to specify whether the call should be recursive (for example, follow objects that point back to other objects or the parent object).

**Note**

Until a host is powered on at least once, Cisco IMC may not have complete inventory and status information. For example, if Cisco IMC is reset, it will not have detailed CPU, memory, or adapter inventory information until the next time the host is powered on. If a query method is performed on a MO corresponding to the unavailable data, the response will be blank.

Configuration Methods

The Cisco IMC XML API supports only a single method to make configuration changes to managed objects:

- configConfMo—Affects a single managed object (for example, a DN).

Event Subscription Methods

Applications get state change information by regular polling or event subscription. For more efficient use of resources, event subscription is the preferred method of notification. Polling should be used only under very limited circumstances.

Use eventSubscribe to register for events, as shown the following example:

```
<eventSubscribe
    cookie="<real_cookie>">
</eventSubscribe>
```

To receive notifications, open an HTTP or HTTPS session over TCP and keep the session open. On receiving eventSubscribe, starts sending all new events as they occur. You can unsubscribe from these events using the [eventUnsubscribe](#) method.

Each event has a unique event ID. Event IDs operate as counters and are included in all method responses. When an event is generated, the event ID counter increments and is assigned as the new event ID. This sequential numbering enables tracking of events and ensures that no event is missed.

An event channel connection opened by a user will be closed automatically by after 600 seconds of inactivity associated with the event channel session cookie. To prevent automatic closing of the event channel connection by , the user must either send the aaaKeepAlive request for the same event channel session cookie within 600 seconds or send any other XML API method to using the same event channel session cookie.

Note

In releases 1.5(1.x) and later, the Cisco IMC API sends event notifications for fault-related events only.

Success or Failure Response

When responds to an XML API request, the response indicates failure if the request is impossible to complete. A successful response indicates only that the request is valid, not that the operation is complete. For example, it may take some time for a server to finish a power-on request. The power state changes from down to up only after the server actually powers on.

Successful Response

When a request has executed successfully, Cisco IMC returns an XML document with the information requested or a confirmation that the changes were made. The following is an example of a configResolveDn query on the distinguished name sys/rack-unit-1/adaptor-2/ext-eth-0:

```
<configResolveDn
```

```
dn="sys/rack-unit-1/adaptor-2/ext-eth-0"
cookie("<real_cookie>")
inHierarchical="false"/>
```

The response includes the following information:

```
<configResolveDn
  cookie("<real_cookie>")
  response="yes"
  dn="sys/rack-unit-1/adaptor-2/ext-eth-0">
  <outConfig>
    <adaptorExtEthIf
      id="0"
      ifType="physical"
      linkState="up"
      mac="00:22:BD:D6:42:DA"
      name=""
      operState="up"
      portId="0"
      purpose="general"
      transport="CE"
      type=""
      dn="sys/rack-unit-1/adaptor-2/ext-eth-0" >
    </adaptorExtEthIf>
  </outConfig>
</configResolveDn>
```

Failed Requests

The response to a failed request includes XML attributes for errorCode and errorDescr. The following is an example of a response to a failed request:

```
<configConfMo dn="sys/rack-unit-1/adaptor-1/ext-eth-0"
  cookie("<real_cookie>")
  response="yes"
  errorCode="103"
  invocationResult="unidentified-fail"
  errorDescr="can't create; object already exists.">
</configConfMo>
```

Empty Results

A query request for a nonexistent object is not treated as a failure by Cisco IMC. If the object does not exist, Cisco IMC returns a success message, but the XML document contains an empty data field (<outConfig> </outConfig>) to indicate that the requested object was not found. The following example shows the response to an attempt to resolve the distinguished name on a nonexistent rack-mount server:

```
<configResolveDn
  cookie("<real_cookie>")
  response="yes"
  dn="sys/rack-unit-1/adaptor-9999">
  <outConfig>
  </outConfig>
</configResolveDn>
```

Empty Results

Using the Cisco IMC XML API Methods

This chapter includes the following sections:

- [Authentication Methods, page 9](#)
- [Query Methods, page 11](#)

Authentication Methods

Authentication allows XML API interaction with the Cisco IMC. It provides a way to set permissions and control the operations that can be performed.

Note

Most code examples in this guide substitute the term <real_cookie> for an actual cookie (such as 1217377205/85f7ff49-e4ec-42fc-9437-da77a1a2c4bf). The Cisco UCS cookie is a 47-character string; it is not the type of cookie that web browsers store locally to maintain session information.

Login

To log in, the XML API client establishes a TCP connection to the Cisco IMC HTTP (or HTTPS) server and posts an XML document containing the aaaLogin method.

In the following example, the Telnet utility is used to establish a TCP connection to port 80 of the Cisco IMC with IP address 192.0.20.72. The path used is /nuova.

```
$ telnet 192.0.20.72 80
POST /nuova HTTP/1.1
USER-Agent: lwp-request/2.06
HOST: 192.0.20.72
Content-Length: 62
Content-Type: application/x-www-form-urlencoded
```

Next, the client specifies the aaaLogin method and provides a user name and password:

```
<aaaLogin
    inName='admin'
```

Refreshing the Session

```

<aaaLogin
    inName='admin'
    inPassword='password'>
</aaaLogin>
```

**Note**

Do not include XML version or DOCTYPE lines in the XML API document. The inName and inPassword attributes are parameters.

Each XML API document represents an operation to be performed. When the request is received as an XML API document, Cisco IMC reads the request and performs the actions as provided in the method. Cisco IMC responds with a message in XML document format and indicates success or failure of the request.

The following is a typical successful response:

```

1 <aaaLogin
2     response="yes"
3     outCookie("<real_cookie>""
4         outRefreshPeriod="600"
5         outPriv="admin">
6 </aaaLogin>
```

Each line in the response should be interpreted as follows:

- 1 Specifies the method used to login.
- 2 Confirms that this is a response.
- 3 Provides the session cookie.
- 4 Specifies the recommended cookie refresh period. The default login session length is 600 seconds.
- 5 Specifies the privilege level assigned to the user account (this can be admin, user, or readonly).
- 6 Closing tag.

Alternatively, you can use the cURL utility to log in to the XML API, as shown in the following example:

`curl -d "<aaaLogin inName='admin' inPassword='password'></aaaLogin>" http://192.0.20.72/nuova`
If HTTPS is enabled, you must use HTTPS in the cURL command, as shown in the following example:

`curl -d "<aaaLogin inName='admin' inPassword='password'></aaaLogin>" https://192.0.20.72/nuova`

Refreshing the Session

Sessions are refreshed with the aaaRefresh method, using the 47-character cookie obtained either from the aaaLogin response or a previous refresh.

```

<aaaRefresh
    cookie("<real_cookie>""
    inCookie("<real_cookie>""
    inName='admin'
    inPassword='password'>
</aaaRefresh>
```

Logging Out of the Session

Use the following method to log out of a session:

```
<aaaLogout
    cookie=<real_cookie>
    inCookie=<real_cookie>
/>
```

Unsuccessful Responses

Failed login:

```
<aaaLogin
    cookie=""
    response="yes"
    errorCode="551"
    invocationResult="unidentified-fail"
    errorDescr="Authentication failed">
/>
```

Nonexistent object (blank return indicates no object with the specified DN):

```
<configResolveDn
    cookie=<real_cookie>
    response="yes"
    dn="sys/rack-unit-1/adaptor-9999">
    <outConfig>
    </outConfig>
/>
```

Bad request:

```
<configConfMo
    cookie=<real_cookie>
    response="yes"
    dn="sys/rack-unit-1/adaptor-1/ext-eth-0">
    errorCode="103"
    invocationResult="unidentified-fail"
    errorDescr="can't create; object already exists.">
/>
```

Query Methods

Using configResolveChildren

When resolving children of objects in the MIT, note the following:

- This method obtains all child objects of a named object that are instances of the named class. If a class name is omitted, all child objects of the named object are returned.
- inDn attribute specifies the named object from which the child objects are retrieved (required).
- classId attribute specifies the name of the child object class to return (optional).

Using configResolveClass

- Authentication cookie (from aaaLogin or aaaRefresh) is required.
- inHierarchical attribute (default = false) if true, specifies that results are hierarchical.
- Enumerated values, classIds, and bit masks are displayed as strings.

See the example request/response in [configResolveChildren, on page 22](#).

Using configResolveClass

When resolving a class, note the following:

- All objects of the specified class type are retrieved.
- classId specifies the object class name to return (required).
- Authentication cookie (from aaaLogin or aaaRefresh) is required.
- inHierarchical attribute (default = false) if true, specifies that results are hierarchical.
- Enumerated values, classIds, and bit masks are displayed as strings.

Result sets can be large. Be precise when defining result sets. For example, to obtain only a list of adapters, use adaptorUnit as the attribute value for classId in the query. This example queries for all instances of the adaptorUnit class:

```
<configResolveClass
  cookie="real_cookie"
  inHierarchical="false"
  classId="adaptorUnit"/>
```

See the example request/response in [configResolveClass, on page 23](#).

Using configResolveDn

When resolving a DN, note the following:

- The object specified by the DN is retrieved.
- Specified DN identifies the object instance to be resolved (required).
- Authentication cookie (from aaaLogin or aaaRefresh) is required.
- inHierarchical attribute (default = false) if true, specifies that results are hierarchical.
- Enumerated values, classIds, and bit masks are displayed as strings.

See the example request/response in [configResolveDn, on page 24](#).

Using configResolveParent

When resolving the parent object of an object, note the following:

- This method retrieves the parent object of a specified DN.

- dn attribute is the DN of the child object (required).
- Authentication cookie (from aaaLogin or aaaRefresh) is required.
- inHierarchical attribute (default = false) if true, specifies that results are hierarchical.
- Enumerated values, classIds, and bit masks are displayed as strings.

See the example request/response in [configResolveParent, on page 25](#).

Using configResolveParent

CHAPTER 3

Cisco IMC XML API Method Descriptions

This chapter includes the following sections:

- [aaaGetComputeAuthTokens, page 15](#)
- [aaaKeepAlive, page 16](#)
- [aaaLogin, page 17](#)
- [aaaLogout, page 18](#)
- [aaaRefresh, page 19](#)
- [configConfMo, page 21](#)
- [configResolveChildren, page 22](#)
- [configResolveClass, page 23](#)
- [configResolveDn, page 24](#)
- [configResolveParent, page 25](#)
- [eventSubscribe, page 26](#)
- [eventUnsubscribe, page 27](#)

aaaGetComputeAuthTokens

The aaaGetComputeAuthTokens method returns authentication tokens that are used to launch the KVM. This generates two temporary authentication tokens that are valid for 60 seconds. The first is the KVM user name and the second token is the password. Using the authorization tokens as credentials, you can access the URL from where you can download the Java Network Launch Protocol (JNLP) file. You can download the JNLP file from the URL and launch it to start a KVM session.

aaaKeepAlive**Note**

- You cannot obtain tokens if the vKVM option is disabled on the Cisco IMC.
- You must have user or admin privileges to the Cisco IMC to obtain the authentication tokens. Users with read-only privileges will not be able to obtain the tokens.
- The authorization tokens expire is 60 seconds; you cannot use the tokens after 60 seconds to access the URL. If you try to access after 60 seconds, the login fails and you get a authentication failure or timeout message.

Request Syntax

```
<xss:element name="aaaGetComputeAuthTokens" type="aaaGetComputeAuthTokens"
substitutionGroup="externalMethod"/>
<xss:complexType name="aaaGetComputeAuthTokens" mixed="true">
<xss:attribute name="cookie" type="stringMin0Max47" use="required"/>
<xss:attribute name="response" type="YesOrNo"/>
</xss:complexType>
```

Response Syntax

```
<xss:element name="aaaGetComputeAuthTokens" type="aaaGetComputeAuthTokens"
substitutionGroup="externalMethod"/>
<xss:complexType name="aaaGetComputeAuthTokens" mixed="true">
<xss:attribute name="cookie" type="xs:string"/>
<xss:attribute name="response" type="YesOrNo"/>
<xss:attribute name="outTokens">
<xss:simpleType>
<xss:restriction base="xs:string">
<xss:minLength value="0"/>
<xss:maxLength value="510"/>
</xss:restriction>
</xss:simpleType>
</xss:attribute>
</xss:complexType>
```

Examples

Request:

```
aaaGetComputeAuthTokens
cookie=<real_cookie> />
```

Response:

```
<aaaGetComputeAuthTokens cookie=<real_cookie> outTokens="1804289383,846930886"
response="yes"> </aaaGetComputeAuthTokens>
```

aaaKeepAlive

The aaaKeepAlive method keeps the session active until the default session time expires, using the same cookie after the method call.

Request Syntax

```
<xs:element name="aaaKeepAlive" type="aaaKeepAlive" substitutionGroup="externalMethod"/>
<xs:complexType name="aaaKeepAlive" mixed="true">
    <xs:attribute name="cookie" type="stringMin0Max47" use="required"/>
    <xs:attribute name="response" type="YesOrNo"/>
</xs:complexType>
```

Response Syntax

```
<xs:element name="aaaKeepAlive" type="aaaKeepAlive" substitutionGroup="externalMethod"/>
<xs:complexType name="aaaKeepAlive" mixed="true">
    <xs:attribute name="cookie" type="xs:string"/>
    <xs:attribute name="response" type="YesOrNo"/>
    <xs:attribute name="errorCode" type="xs:unsignedInt"/>
    <xs:attribute name="errorDescr" type="xs:string"/>
    <xs:attribute name="invocationResult" type="xs:string"/>
</xs:complexType>
```

Examples

Request

```
<aaaKeepAlive
cookie=<real_cookie>>
</aaaKeepAlive>
```

Response

```
<aaaKeepAlive cookie=<real_cookie> response="yes"> </aaaKeepAlive>
```

aaaLogin

The aaaLogin method is the login process and is required to begin a session. This action establishes the HTTP (or HTTPS) session between the client and Cisco IMC.

Request Syntax

```
<xs:element name="aaaLogin" type="aaaLogin" substitutionGroup="externalMethod"/>
<xs:complexType name="aaaLogin" mixed="true">
    <xs:attribute name="inName" use="required">

        <xs:restriction base="xs:string">
          <xs:enumeration value="fullssl"/>
          <xs:enumeration value="noencssl"/>
          <xs:enumeration value="plain"/>
        </xs:restriction>
      </xs:simpleType>
    </xs:attribute>
    <xs:attribute name="outEvtChannel">
      <xs:simpleType>
        <xs:restriction base="xs:string">
          <xs:enumeration value="fullssl"/>
          <xs:enumeration value="noencssl"/>
          <xs:enumeration value="plain"/>
        </xs:restriction>
      </xs:simpleType>
    </xs:attribute>
    <xs:attribute name="outSessionId">
      <xs:simpleType>
        <xs:restriction base="xs:string">
          <xs:minLength value="0"/>
          <xs:maxLength value="32"/>
        </xs:restriction>
      </xs:simpleType>
    </xs:attribute>
    <xs:attribute name="outVersion" type="xs:string"/>
    <xs:attribute name="cookie" type="xs:string"/>
    <xs:attribute name="response" type="YesOrNo"/>
    <xs:attribute name="errorCode" type="xs:unsignedInt"/>
    <xs:attribute name="errorDescr" type="xs:string"/>
    <xs:attribute name="invocationResult" type="xs:string"/>
  </xs:complexType>

```

Examples**Request**

```
<aaaLogin inName='admin' inPassword='password'/>
```

Response

```
<aaaLogin cookie="" response="yes" outCookie=<real_cookie> outRefreshPeriod="600"
outPriv="admin" outSessionId="17" outVersion="3.0(0.149)"> </aaaLogin>
```

aaaLogout

The aaaLogout method is a process to close a web session by passing the session cookie as input. It is not automatic; the user has to explicitly invoke the aaaLogout method to terminate the session.

Request Syntax

```
<xs:element name="aaaLogout" type="aaaLogout" substitutionGroup="externalMethod"/>
<xs:complexType name="aaaLogout" mixed="true">
    <xs:attribute name="inCookie" type="stringMin0Max47" use="required"/>
    <xs:attribute name="cookie" type="stringMin0Max47"/>
    <xs:attribute name="response" type="YesOrNo"/>
</xs:complexType>
```

Response Syntax

```
<xs:element name="aaaLogout" type="aaaLogout" substitutionGroup="externalMethod"/>
<xs:complexType name="aaaLogout" mixed="true">
    <xs:attribute name="outStatus">
        <xs:simpleType>
            <xs:restriction base="xs:string">
                <xs:enumeration value="success"/>
                <xs:enumeration value="failure"/>
            </xs:restriction>
        </xs:simpleType>
    </xs:attribute>
    <xs:attribute name="cookie" type="xs:string"/>
    <xs:attribute name="response" type="YesOrNo"/>
    <xs:attribute name="errorCode" type="xs:unsignedInt"/>
    <xs:attribute name="errorDescr" type="xs:string"/>
    <xs:attribute name="invocationResult" type="xs:string"/>
</xs:complexType>
```

Examples

Request

```
<aaaLogout cookie=<real_cookie> inCookie=<real_cookie>></aaaLogout>
```

Response

```
<aaaLogout cookie=<real_cookie> response="yes" outStatus="success"> </aaaLogout>
```

aaaRefresh

The aaaRefresh method keeps sessions active (within the default session time frame) by user activity. There is a default of 600 seconds that counts down when inactivity begins. If the 600 seconds expire, Cisco IMC enters a sleep mode. It requires signing back in, which restarts the countdown. It continues using the same session ID.

Note

Using this method expires the previous cookie and issues a new cookie.

Request Syntax

```
<xs:element name="aaaRefresh" type="aaaRefresh" substitutionGroup="externalMethod"/>
<xs:complexType name="aaaRefresh" mixed="true">
    <xs:attribute name="inName" use="required">
        <xs:simpleType>
            <xs:restriction base="xs:string">
```

aaaRefresh

```

        <xs:pattern value="[-\.:_a-zA-Z0-9]{0,16}" />
    </xs:restriction>
</xs:simpleType>
</xs:attribute>
<xs:attribute name="inPassword" use="required">
    <xs:simpleType>
        <xs:restriction base="xs:string">
            <xs:minLength value="0"/>
            <xs:maxLength value="510"/>
        </xs:restriction>
    </xs:simpleType>
</xs:attribute>
<xs:attribute name="inCookie" type="stringMin0Max47" use="required"/>
<xs:attribute name="cookie" type="stringMin0Max47"/>
<xs:attribute name="response" type="YesOrNo"/>
</xs:complexType>

```

Response Syntax

```

<xs:element name="aaaRefresh" type="aaaRefresh" substitutionGroup="externalMethod"/>
<xs:complexType name="aaaRefresh" mixed="true">
    <xs:attribute name="outCookie" type="xs:string"/>
    <xs:attribute name="outRefreshPeriod" type="xs:unsignedInt"/>
    <xs:attribute name="outPriv">
        <xs:simpleType>
            <xs:restriction base="xs:string">
                <xs:pattern value="(read-only|admin|user){0,1}" />
            </xs:restriction>
        </xs:simpleType>
    </xs:attribute>
    <xs:attribute name="outDomains" type="xs:string"/>
    <xs:attribute name="outChannel">
        <xs:simpleType>
            <xs:restriction base="xs:string">
                <xs:enumeration value="fullssl"/>
                <xs:enumeration value="noencssl"/>
                <xs:enumeration value="plain"/>
            </xs:restriction>

<aaaRefresh cookie=<real_cookie> inCookie=<real_cookie> inName="admin"

```

```
inPassword="password">
</aaaRefresh>
```

Response

```
<aaaRefresh
    cookie=<real_cookie>
    response="yes"
    outCookie=<real_cookie>
    outRefreshPeriod="600"
    outPriv="admin">
</aaaRefresh>
```

configConfMo

The configConfMo method configures the specified managed object in a single subtree (for example, DN).

Request Syntax

```
<xs:element name="configConfMo" type="configConfMo" substitutionGroup="externalMethod"/>
<xs:complexType name="configConfMo" mixed="true">
    <xs:all>
        <xs:element name="inConfig" type="configConfig" minOccurs="1"/>
    </xs:all>
    <xs:attribute name="inHierarchical">
        <xs:simpleType>
            <xs:union memberTypes="xs:boolean YesOrNo"/>
        </xs:simpleType>
    </xs:attribute>
    <xs:attribute name="cookie" type="stringMin0Max47" use="required"/>
    <xs:attribute name="response" type="YesOrNo"/>
    <xs:attribute name="dn" type="referenceObject" use="required"/>
</xs:complexType>
```

Response Syntax

```
<xs:element name="configConfMo" type="configConfMo" substitutionGroup="externalMethod"/>
<xs:complexType name="configConfMo" mixed="true">
    <xs:all>
        <xs:element name="outConfig" type="configConfig" minOccurs="0"/>
    </xs:all>
    <xs:attribute name="cookie" type="xs:string"/>
    <xs:attribute name="response" type="YesOrNo"/>
    <xs:attribute name="errorCode" type="xs:unsignedInt"/>
    <xs:attribute name="errorDescr" type="xs:string"/>
    <xs:attribute name="invocationResult" type="xs:string"/>
    <xs:attribute name="dn" type="referenceObject"/>
</xs:complexType>
```

Examples

Request

```
<configConfMo
    cookie=<real_cookie>
    dn='sys/rack-unit-1/locator-led'>
    <inConfig>
        <equipmentLocatorLed
            adminState='on' dn='sys/rack-unit-1/locator-led'>
        </equipmentLocatorLed>
```

configResolveChildren

```
</inConfig>
</configConfMo>
```

Response

```
<configConfMo dn="sys/rack-unit-1/locator-led"
cookie="1461754266/2f609b81-3176-1176-8007-4cc92474a254" response="yes">
<outConfig>
<equipmentLocatorLed dn="sys/rack-unit-1/locator-led" adminState="inactive" color="unknown"
id="1" name="" operState="off" status="modified"/></outConfig>
</configConfMo>
```

configResolveChildren

The configResolveChildren method retrieves children of managed objects under a specific DN in the managed information tree.

Request Syntax

```
<xs:element name="configResolveChildren" type="configResolveChildren"
substitutionGroup="externalMethod"/>
<xs:complexType name="configResolveChildren" mixed="true">
<xs:attribute name="inDn" type="referenceObject" use="required"/>
<xs:attribute name="inHierarchical">
<xs:simpleType>
<xs:union memberTypes="xs:boolean YesOrNo"/>
</xs:simpleType>
</xs:attribute>
<xs:attribute name="cookie" type="stringMin0Max47" use="required"/>
<xs:attribute name="response" type="YesOrNo"/>
<xs:attribute name="classId" type="namingClassId"/>
</xs:complexType>
```

Response Syntax

```
<xs:element name="configResolveChildren" type="configResolveChildren"
substitutionGroup="externalMethod"/>
<xs:complexType name="configResolveChildren" mixed="true">
<xs:all>
<xs:element name="outConfigs" type="configSet" minOccurs="0"/>
</xs:all>
<xs:attribute name="cookie" type="xs:string"/>
<xs:attribute name="response" type="YesOrNo"/>
<xs:attribute name="errorCode" type="xs:unsignedInt"/>
<xs:attribute name="errorDescr" type="xs:string"/>
<xs:attribute name="invocationResult" type="xs:string"/>
<xs:attribute name="classId" type="namingClassId"/>
</xs:complexType>
```

Examples**Request**

```
<configResolveChildren cookie=<real_cookie> inHierarchical="false" inDn="sys"/>
```

Response

```
<configResolveChildren cookie="1461754266/2f609b81-3176-1176-8007-4cc92474a254"
response="yes"> <outConfigs> <computeRackUnit dn="sys/rack-unit-1" adminPower="policy"

```

configResolveClass

The configResolveClass method returns requested managed object in a given class. If inHierarchical=true, the results contain children.

Request Syntax

```

<xs:element name="configResolveClass" type="configResolveClass"
substitutionGroup="externalMethod"/>
    <xs:complexType name="configResolveClass" mixed="true">
        <xs:attribute name="inHierarchical">
            <xs:simpleType>
                <xs:union memberTypes="xs:boolean YesOrNo"/>
            </xs:simpleType>
        </xs:attribute>
        <xs:attribute name="cookie" type="stringMin0Max47" use="required"/>
        <xs:attribute name="response" type="YesOrNo"/>
        <xs:attribute name="classId" type="namingClassId" use="required"/>
    </xs:complexType>

```

Response Syntax

```

<xs:element name="configResolveClass" type="configResolveClass"
substitutionGroup="externalMethod"/>
    <xs:complexType name="configResolveClass" mixed="true">
        <xs:all>
            <xs:element name="outConfigs" type="configSet" minOccurs="0"/>
        </xs:all>
        <xs:attribute name="cookie" type="xs:string"/>
        <xs:attribute name="response" type="YesOrNo"/>
        <xs:attribute name="errorCode" type="xs:unsignedInt"/>
        <xs:attribute name="errorDescr" type="xs:string"/>
        <xs:attribute name="invocationResult" type="xs:string"/>
        <xs:attribute name="classId" type="namingClassId"/>
    </xs:complexType>

```

configResolveDn

Examples

Request

```
<configResolveClass cookie=<real_cookie> inHierarchical="false" classId="topSystem"/>
```

Response

```
<configResolveClass cookie=<real_cookie> response="yes" classId="topSystem">
<outConfigs> <topSystem dn="sys" address="10.10.10.10" currentTime="Wed Apr 27 10:51:08
2016 "
localTime="Wed Apr 27 13:51:08 2016 EAT +0300" timeZone="Africa/Addis Ababa"
mode="stand-alone"
name="Cxxx-FCH1917V0P1" >
</topSystem>
</outConfigs>
</configResolveClass>
```

configResolveDn

The configResolveDn method retrieves a single managed object for a specified DN.

Request Syntax

```
<xs:element name="configResolveDn" type="configResolveDn" substitutionGroup="externalMethod"/>

<xs:complexType name="configResolveDn" mixed="true">
<xs:attribute name="inHierarchical">
<xs:simpleType>
<xs:union memberTypes="xs:boolean YesOrNo"/>
</xs:simpleType>
</xs:attribute>
<xs:attribute name="cookie" type="stringMin0Max47" use="required"/>
<xs:attribute name="response" type="YesOrNo"/>
<xs:attribute name="dn" type="referenceObject" use="required"/>
</xs:complexType>
```

Response Syntax

```
<xs:element name="configResolveDn" type="configResolveDn"
substitutionGroup="externalMethod"/>
<xs:complexType name="configResolveDn" mixed="true">
<xs:all>
<xs:element name="outConfig" type="configConfig" minOccurs="0"/>
</xs:all>
<xs:attribute name="cookie" type="xs:string"/>
<xs:attribute name="response" type="YesOrNo"/>
<xs:attribute name="errorCode" type="xs:unsignedInt"/>
<xs:attribute name="errorDescr" type="xs:string"/>
<xs:attribute name="invocationResult" type="xs:string"/>
<xs:attribute name="dn" type="referenceObject"/>
</xs:complexType>
```

Examples

Request

```
<configResolveDn cookie="1461754266/2f609b81-3176-1176-8007-4cc92474a254"
inHierarchical="false" dn="sys/rack-unit-1"/>
```

Response

```
<configResolveDn cookie=<real_cookie> response="yes" dn="sys/rack-unit-1">
<outConfig> <computeRackUnit dn="sys/rack-unit-1" adminPower="policy" availableMemory="16384"
model="UCSC-Cxxx-M3S" memorySpeed="1333" name="UCS Cxxx M3S" numOfAdaptors="1" numOfCores="8"
numOfCoresEnabled="8" numOfCpus="2" numOfEthHostIfs="2" numOfFcHostIfs="2" numOfThreads="8"
operPower="on" originalUuid="3FDC58B1-26CF-4CFA-BFA9-B028047280B1" presence="equipped"
serverId="1" serial="FCH1917V0P1" totalMemory="16384" usrlbl=""'
uuid="3FDC58B1-26CF-4CFA-BFA9-B028047280B1" vendor="Cisco Systems Inc"
cimcResetReason="graceful-reboot" assetTag="in demo" >
</computeRackUnit>
</outConfig>
</configResolveDn>
```

configResolveParent

For a specified DN, the configResolveParent method retrieves the parent of the managed object.

Request Syntax

```
<xs:element name="configResolveParent" type="configResolveParent"
substitutionGroup="externalMethod"/>
<xs:complexType name="configResolveParent" mixed="true">
<xs:attribute name="inHierarchical">
<xs:simpleType>
<xs:union memberTypes="xs:boolean YesOrNo"/>
</xs:simpleType>
</xs:attribute>
<xs:attribute name="cookie" type="stringMin0Max47" use="required"/>
<xs:attribute name="response" type="YesOrNo"/>
<xs:attribute name="dn" type="referenceObject" use="required"/>
</xs:complexType>
```

Response Syntax

```
<xs:element name="configResolveParent" type="configResolveParent"
substitutionGroup="externalMethod"/>
<xs:complexType name="configResolveParent" mixed="true">
<xs:all>
<xs:element name="outConfig" type="configConfig" minOccurs="0"/>
</xs:all>
<xs:attribute name="cookie" type="xs:string"/>
<xs:attribute name="response" type="YesOrNo"/>
<xs:attribute name="errorCode" type="xs:unsignedInt"/>
<xs:attribute name="errorDescr" type="xs:string"/>
<xs:attribute name="invocationResult" type="xs:string"/>
<xs:attribute name="dn" type="referenceObject"/>
</xs:complexType>
```

Examples

Request

```
<configResolveParent cookie=<real_cookie> inHierarchical="false" dn="sys/rack-unit-1"/>
```

Response

```
<configResolveParent cookie=<real_cookie> response="yes" dn="sys/rack-unit-1">
<outConfig>
```

eventSubscribe

```
<topSystem dn="sys" address="10.197.125.42" currentTime="Wed Apr 27 10:53:26 2016 "
    localTime="Wed Apr 27 13:53:26 2016 EAT +0300" timeZone="Africa/Addis Ababa"
    mode="stand-alone"
    name="Cxxx-FCH1917V0P1" >
</topSystem>
</outConfig>
</configResolveParent>
```

eventSubscribe

The eventSubscribe method allows a client to subscribe to asynchronous System Event Log (SEL) events generated by Cisco IMC.

Event subscription allows a client application to register for event notification from Cisco IMC. When an event occurs, Cisco IMC informs the client application of the event and its type. Only the actual change information is sent. The object's unaffected attributes are not included.

Use eventSubscribe to register for events as shown in the following example:

```
<eventSubscribe
    cookie=<real_cookie>>
</eventSubscribe>
```

Request Syntax

```
<xs:element name="eventSubscribe" type="eventSubscribe" substitutionGroup="externalMethod"/>

<xs:complexType name="eventSubscribe" mixed="true">
    <xs:attribute name="cookie" type="stringMin0Max47" use="required"/>
    <xs:attribute name="response" type="YesOrNo"/>
</xs:complexType>
```

Response Syntax

```
<xs:element name="eventSubscribe" type="eventSubscribe"
substitutionGroup="externalMethod"/>
<xs:complexType name="eventSubscribe" mixed="true">
    <xs:attribute name="cookie" type="xs:string"/>
    <xs:attribute name="response" type="YesOrNo"/>
    <xs:attribute name="errorCode" type="xs:unsignedInt"/>
    <xs:attribute name="errorDescr" type="xs:string"/>
    <xs:attribute name="invocationResult" type="xs:string"/>
</xs:complexType>
```

Examples**Request**

```
<eventSubscribe
    cookie=<real_cookie>>
</eventSubscribe>
```

Response

NO RESPONSE OR ACKNOWLEDGMENT.

eventUnsubscribe

The eventUnsubscribe method allows a client to unsubscribe from asynchronous System Event Log (SEL) events generated by Cisco IMC, reversing event subscriptions that resulted from eventUnsubscribe.

Use eventUnsubscribe to unsubscribe from events as shown in the following example:

```
<eventUnsubscribe
    cookie=<real_cookie>>
</eventUnsubscribe>
```

Request Syntax

```
<xs:element name="eventUnsubscribe" type="eventUnsubscribe"
substitutionGroup="externalMethod"/>
    <xs:complexType name="eventUnsubscribe" mixed="true">
        <xs:attribute name="cookie" type="stringMin0Max47" use="required"/>
        <xs:attribute name="response" type="YesOrNo"/>
    </xs:complexType>
```

Response Syntax

```
<xs:element name="eventUnsubscribe" type="eventUnsubscribe"
substitutionGroup="externalMethod"/>
    <xs:complexType name="eventUnsubscribe" mixed="true">
        <xs:attribute name="cookie" type="xs:string"/>
        <xs:attribute name="response" type="YesOrNo"/>
        <xs:attribute name="errorCode" type="xs:unsignedInt"/>
        <xs:attribute name="errorDescr" type="xs:string"/>
        <xs:attribute name="invocationResult" type="xs:string"/>
    </xs:complexType>
```

Examples

Request

```
<eventUnsubscribe
    cookie=<real_cookie>>
</eventUnsubscribe>
```

Response

NO RESPONSE OR ACKNOWLEDGMENT.

eventUnsubscribe

CHAPTER 4

Cisco IMC XML Schema Definition Files

This chapter includes the following sections:

- [About the Cisco IMC XML Schema Definition Files, page 29](#)
- [Examples of RACK-IN.xsd Usage, page 30](#)
- [Examples of RACK-OUT.xsd Usage, page 32](#)

About the Cisco IMC XML Schema Definition Files

The C-Series XML API provides users with input XML Schema Definition (xsd) files for every model and a schema definition file for the output:

- RACK-IN.xsd — This document defines the XML document structure for a valid XML request that the Cisco IMC XML API accepts. It also specifies the classes and attributes that you can provide to the XML API configConfMo (Set) requests.
- RACK-OUT.xsd — This document defines the XML document structure for a valid XML response that the Cisco IMC XML API displays. It also specifies the classes and attributes that must appear in the XML API responses.

You can obtain these files from the Cisco IMC at:

RACK-IN.xsd — <https://<Cisco IMC-IP>/visore/RACK-IN.xsd>

RACK-OUT — <https://<Cisco IMC-IP>/visore/RACK-OUT.xsd>

You also can download these files from the Cisco Developer Network, at: <http://developer.cisco.com/web/unifiedcomputing/c-series-cime-xml-api>.

You can use one of the available open source tools to validate the XML document against the XML schema files. In the examples used in this section, xmllint available for download at: www.xmlsoft.org is used as the tool for validation. You also can use the xml schema validation feature of a programming language, for example xerces in Java, for this validation.

Examples of RACK-IN.xsd Usage

Validating an XML Request Using RACK-IN.xsd

Example of Use of the RACK-IN.xsd for an Invalid configResolveClass Request

Request:

```
$cat myXMLRequest.xml
<configResolveClass cookie="1360626069/7189c2b0-d57b-157b-8002-f4759de53d50"
inHierarchical="false"/>
```

Validating the request:

```
/usr/bin/xmllint -schema ./RACK-IN.xsd myXMLRequest.xml
<configResolveClass cookie="1360626069/7189c2b0-d57b-157b-8002-f4759de53d50"
inHierarchical="false"/>
```

Response:

```
myXMLRequest.xml:1: element configResolveClass:
Schemas validity error : Element 'configResolveClass': The attribute 'classId' is required
but missing.
```

In the preceding example, validation of the XML request fails and displays an error because the 'classId' is missing in the request.

Example of Use of the RACK-IN.xsd for a Valid configResolveClass Request

Request:

```
$cat myXMLRequest.xml
<configResolveClass cookie="1360626069/7189c2b0-d57b-157b-8002-f4759de53d50"
inHierarchical="false" classId="topSystem"/>
```

Request:

```
/usr/bin/xmllint -schema ./RACK-IN.xsd myXMLRequest.xml
<configResolveClass cookie="1360626069/7189c2b0-d57b-157b-8002-f4759de53d50"
inHierarchical="false" classId="topSystem"/>
```

In the preceding example, validation of the XML request for a classResolveClass is successful and the response is displayed.

Example of Use of the RACK-IN.xsd for an Invalid configConfMo Request

Request:

```
$cat setRackUnit.xml
<configConfMo cookie="1300242644/ad04d239-d1aa-498d-b074-ccb923066003"
dn="sys/rack-unit-1" inHierarchical="false">
  <inConfig>
    <computeRackUnit adminPower="down" usrLbl="UCS Cxxx server For Demo"
      availableMemory="16384" dn="sys/rack-unit-1"/>
  </inConfig>
</configConfMo>
```

Validating the request:

```
/usr/bin/xmllint -schema ./RACK-IN.xsd /setRackUnit.xml
<configConfMo cookie="1300242644/ad04d239-d1aa-498d-b074-ccb923066003"
dn="sys/rack-unit-1" inHierarchical="false">
  <inConfig>
    <computeRackUnit adminPower="down" usrLbl="UCS Cxxx server For Demo"
      availableMemory="16384" dn="sys/rack-unit-1"/>
  </inConfig>
</configConfMo>
```

Response:

```
/setRackUnit.xml:3: element computeRackUnit: Schemas validity error :
Element 'computeRackUnit', attribute 'availableMemory': The attribute 'availableMemory' is not allowed.
/setRackUnit.xml fails to validate
```

The availableMemory attribute is read-only in the computeRackUnit class. You can view the read/write attributes in computeRackUnit that can be set using configConfMo XML by looking at the computeRackUnit definition in RACK-IN.xsd. A sample snippet is as follows:

```
<!--computeRackUnit-->
<xss:element name="computeRackUnit" type="computeRackUnit"
substitutionGroup="managedObject"/>
<xss:complexType name="computeRackUnit" mixed="true">

    <xss:attribute name="adminPower">
        <xss:simpleType>
            <xss:restriction base="xss:string">
                <xss:enumeration value="up"/>
                <xss:enumeration value="down"/>
                <xss:enumeration value="soft-shut-down"/>
                <xss:enumeration value="cycle-immediate"/>
                <xss:enumeration value="hard-reset-immediate"/>
                <xss:enumeration value="bmc-reset-immediate"/>
                <xss:enumeration value="bmc-reset-default"/>
                <xss:enumeration value="cmos-reset-immediate"/>
                <xss:enumeration value="diagnostic-interrupt"/>
            </xss:restriction>
        </xss:simpleType>
    </xss:attribute>

    <xss:attribute name="usrLbl">
        <xss:simpleType>
            <xss:restriction base="xss:string">
                <xss:pattern value="[!#$%& \(\) \*\+, \-\./; \?@\[ \] \{\| \}~a-zA-Z0-9]{0,64}" />
            </xss:restriction>
        </xss:simpleType>
    </xss:attribute>

    <xss:attribute name="dn" type="referenceObject"/>
    <xss:attribute name="rn" type="referenceRn"/>
    <xss:attribute name="status" type="objectStatus"/>
</xss:complexType>
```

Example of Use of the RACK-IN.xsd for an Invalid configConfMo Request

Request:

```
$ cat setBootOrder.xml
<configConfMo cookie="1360205300/79c672f0-d519-1519-8004-30339ee53d50"
inHierarchical="true" dn="sys/rack-unit-1/boot-policy">
    <inConfig>
        <lsbootDef dn="sys/rack-unit-1/boot-policy" name="boot-policy" purpose="operational"
rebootOnUpdate="no">
            <lsbootVirtualMedia access="read-only" order="2" type="virtual-media"
rn="vm-read-only"/>
            <lsbootVirtualMedia access="read-write" order="3" type="virtual-media"
rn="vm-read-write"/>
            <lsbootLan rn="lan-read-only" access="read-only" order="4" prot="pxe" type="lan"/>
            <lsbootStorage rn="storage-read-write" access="read-write" order="1" type="storage">
                <lsbootLocalStorage rn="local-storage"/>
            </lsbootStorage>
            <lsbootEfi rn="efi-read-only" access="read-only" order="5" type="efi"/>
        </lsbootDef>
    </inConfig>
</configConfMo>
```

Examples of RACK-OUT.xsd Usage

Validating the request:

```
/usr/bin/xmllint -schema ./RACK-IN.xsd ./setBootOrder.xml
<configConfMo cookie="1360205300/79c672f0-d519-1519-8004-30339ee53d50"
inHierarchical="true" dn="sys/rack-unit-1/boot-policy">
  <inConfig>
    <lsbootDef dn="sys/rack-unit-1/boot-policy" name="boot-policy" purpose="operational"
rebootOnUpdate="no">
      <lsbootVirtualMedia access="read-only" order="2" type="virtual-media"
rn="vm-read-only"/>
      <lsbootVirtualMedia access="read-write" order="3" type="virtual-media"
rn="vm-read-write"/>
      <lsbootLan rn="lan-read-only" access="read-only" order="4" prot="pxe" type="lan"/>
      <lsbootStorage rn="storage-read-write" access="read-write" order="1" type="storage">
        <lsbootLocalStorage rn="local-storage"/>
      </lsbootStorage>
      <lsbootEfi rn="efi-read-only" access="read-only" order="5" type="efi"/>
    </lsbootDef>
  </inConfig>
</configConfMo>
```

Response:

```
./setBootOrder.xml:3: element lsbootDef: Schemas validity error :
Element 'lsbootDef', attribute 'name': The attribute 'name' is not allowed.
./setBootOrder.xml:3: element lsbootDef: Schemas validity error :
Element 'lsbootDef', attribute 'purpose': The attribute 'purpose' is not allowed.
./setBootOrder.xml fails to validate
```

Name and purpose attributes of class LsBootDef are read-only and cannot be used in the configConMo/set request.

Example of Use of the RACK-IN.xsd for a Valid configConfMo Request

Request:

```
usr/bin/xmllint -schema ./RACK-IN.xsd /setRackUnit.xml
<configConfMo cookie="1300242644/ad04d239-d1aa-498d-b074-ccb923066003"
dn="sys/rack-unit-1" inHierarchical="false">
  <inConfig>
    <computeRackUnit adminPower="down" usrLbl="UCS Cxxx server For Demo"
dn="sys/rack-unit-1"/>
  </inConfig>
</configConfMo>
```

xsd file validates the request and completes the configuration.

Examples of RACK-OUT.xsd Usage

Validating an XML Request Using RACK_OUT.xsd**Example of Use of the RACK-OUT.xsd for a configResolveClass Request**

Request:

```
<configResolveClass cookie="1360632361/e892fa10-d57c-157c-8003-f4759de53d50"
inHierarchical="false" classId="computeRackUnit"/>
https://172.xx.219.xx/nuova | xmllint -format - | xmllint -schema ./RACK-OUT.xsd -
```

Response:

```
<configResolveClass cookie="1360632361/e892fa10-d57c-157c-8003-f4759de53d50"
response="yes" classId="computeRackUnit">
  <outConfigs>
    <computeRackUnit dn="sys/rack-unit-1" adminPower="policy" availableMemory="16384"
model="UCSC-Cxxx-M3L"
      memorySpeed="1333" name="UCS Cxxx M3L" numOfAdaptors="1" numOfCores="16"
      numOfCoresEnabled="16" numOfCpus="2"
```

```

    numOfEthHostIfs="2" numOfFcHostIfs="3" numOfThreads="32" operPower="on"
    originalUuid="2E5D2295-F32D-48C9-BE8E-BAD36BE174FB" presence="equipped" serverId="1"
    serial="FCH1551V030"
    totalMemory="16384" usrLbl="SL2_=+@#$-;,.\/" uuid="2E5D2295-F32D-48C9-BE8E-BAD36BE174FB"

        vendor="Cisco Systems Inc"/>
    </outConfigs>
</configResolveClass>
```

Rack-out.xsd validates the output successfully.

Example of Use of the RACK-OUT.xsd for a configResolveClass Request

Request:

```
$ /usr/bin/curl -k -d'<configResolveClass
cookie="1361150931/a5bacff0-d5f5-15f5-8007-f4759de53d50"
inHierarchical="true" classId="topSystem"/>' https://172.29.219.74/nuova >
Cxxx_complete_MIT.xml
real 0m35.065s
user 0m0.016s
sys 0m0.044s
```

Validating the response:

```
$ ls -l Cxxx_complete_MIT.xml
-rw-r--r--. 1 sajaffer eng58 64905 Feb 17 17:46 Cxxx_complete_MIT.xml

$ /usr/bin/xmllint --schema RACK-OUT.xsd Cxxx_complete_MIT.xml 1>/dev/null
Cxxx_complete_MIT.xml validates
```

The preceding XML requests retrieve the complete management information tree of a C-Series server and validate the response against RACK-OUT.xsd

CHAPTER 5

Cisco IMC XML Object-Access Privileges

This chapter includes the following sections:

- [Privileges Summary Table, page 35](#)
- [Privileges, page 35](#)

Privileges Summary Table

When users are assigned to a role, that role allows certain privileges. Those privileges allow the user access to specific system resources and authorize permission to perform tasks on those resources. The following table lists each privilege and the initial default user role that has been given that privilege.

Internal Name	Label	Description
admin, on page 35	ADMIN	Access to everything
read-only, on page 36	READ_ONLY	Read-only access
user, on page 36	USER	Limited configuration access

Privileges

admin

Purpose

System administration

Responsible Role

Administrator

read-only**Controlled Objects**

This role is system level. The administrator controls all objects.

read-only**Purpose**

Read-only access

Responsible Role

This is not a selectable privilege. All roles have read-only access to all objects. Roles that have read-write privileges on some objects also have read-only access to all other objects.

user**Purpose**

Restricted configuration

Responsible Role

User

Controlled Objects

This role can perform the following tasks:

- View all information
- Manage the power control options such as power on, power cycle, and power off
- Launch the KVM console and virtual media
- Clear all logs
- Toggle the locator LED
- Set time zone
- Ping

APPENDIX

A

Examples of Common Server Management Tasks

The examples in this chapter show how to use the Cisco IMC XML API to perform common server management tasks. Each example shows the XML API request followed by the response from Cisco IMC.

This chapter includes the following examples:

- [Using Cisco IMC LDAP User Credentials to Establish XML API Session Cookie, on page 43](#)
- [Retrieving Server Summary Information and Host Power State, on page 43](#)
- [Retrieving Current Running Firmware Versions of Server Components, on page 44](#)
- [Retrieving Backup Firmware Version Installed on Cisco IMC, on page 44](#)
- [Activating Firmware Backup Image on Cisco IMC, on page 45](#)
- [Using the inHierarchical Option to Retrieve Configured Boot Order Table, on page 45](#)
- [Retrieving Power Supply Unit Details on Server, on page 45](#)
- [Retrieving Details of Fan Object Identified by DN, on page 46](#)
- [Retrieving SNMP Configuration Details, on page 46](#)
- [Retrieving Status of Local Hard Disk on Server, on page 46](#)
- [Power Cycling the Server, on page 47](#)
- [Configuring EFI as the Second Boot Device in Boot Order Table, on page 47](#)
- [Removing Floppy Disk Drive as a Boot Device From the Boot Order List, on page 47](#)
- [Configuring Boot Order to HDD, CDROM, FDD, PXE, and EFI Without Rebooting the Host, on page 48](#)
- [Using inHierarchical Option to Change and Retrieve SNMP Configuration of Trap Receivers, on page 48](#)
- [Retrieving Select Memory RAS BIOS Token, on page 49](#)
- [Configuring Select Memory RAS BIOS Token for Mirroring Mode, on page 49](#)
- [Retrieving C240 Server BIOS Token Values, on page 50](#)
- [Retrieving Default Values of BIOS Tokens, on page 51](#)
- [Using Platform-Default to Configure BIOS Parameters to Default Values, on page 52](#)

- Setting the Out-Of-Band-Mgmt-Port BIOS Token Value, on page 53
- Using TFTP to Export Cisco IMC Configuration Data, on page 53
- Using TFTP to Import Cisco IMC Configuration Data, on page 54
- Using TFTP to Export Cisco IMC Technical Support Data, on page 55
- Retrieving CPU Product ID Details, on page 56
- Retrieving IMM/ Memory Unit Product ID Details, on page 57
- Retrieving HDD Product ID Details, on page 57
- Retrieving PCI Adapter Product ID Details, on page 58
- Retrieving Firmware Update Details, on page 58
- Updating Cisco IMC Firmware, on page 58
- Updating BIOS Firmware, on page 59
- Using Non-Interactive HUU to Update Firmware on all C-Series Server Components, on page 60
- Using TFTP to Import VIC Adapter Configuration Data, on page 61
- Using TFTP to Update VIC Firmware, on page 62
- Configuring VIC Adapter Parameters, on page 62
- Retrieving VIC Adapter General Profile Details, on page 68
- Retrieving VIC Adapter Uplink Port Details, on page 68
- Setting Uplink Port Speed of a VIC Adapter, on page 68
- Retrieving Adapter Ethernet Interface Details, on page 69
- Creating Adapter Ethernet Interface, on page 70
- Modifying Properties of Ethernet Interface, on page 71
- Deleting Ethernet Interface, on page 72
- Retrieving Adapter Fibre Channel Interface Details, on page 72
- Creating Boot Entry for a Fibre Channel Interface, on page 73
- Configuring HUU for One-Time Boot, on page 73
- Mounting Share to the VMedia with Username, on page 74
- Mounting Share to the VMedia Without the Username, on page 74
- Setting Remotesyslog Primary Server, on page 74
- Setting Remotesyslog Secondary Server, on page 75
- Retrieving Syslog Client-Server Details, on page 75
- Retrieving LOM MAC Address Support Details, on page 75
- Retrieving MAC Address of Individual Ports of Network Controllers, on page 76
- Retrieving LOM MAC Address of Individual Ports, on page 76

- Retrieving LSI Storage Adapter Summary Properties Installed on C-Series Server, on page 76
- Retrieving LSI Storage Adapter Detailed Properties Installed on C-Series Server, on page 84
- Retrieving LSI Storage Adapter Details of RAID Battery, on page 84
- Retrieving Summary Information of Local Disks (HDD), on page 85
- Retrieving Detailed Information of Local Disks (HDD), on page 87
- Retrieving Details of All Virtual Drives Configured in LSI Adapters, on page 90
- Retrieving Details of Physical Disks Usage by Virtual Drives, on page 90
- Retrieving Storage Controller Security Key, on page 91
- Retrieving Suggested Storage Controller Security Key, on page 91
- Retrieving Self-encrypted Storage Controller Details, on page 91
- Enabling Self-encryption on Controllers, on page 92
- Disabling Self-encryption on Controllers, on page 92
- Enabling Self-encryption on Physical Drives, on page 92
- Creating Secured Virtual Drive Group, on page 93
- Unlocking Secure Drives on Controllers, on page 93
- Erasing Data on Secure Unconfigured Good Drives, on page 94
- Erasing Data on Secure Foreign Drives, on page 94
- Modifying the Controller Key ID, on page 94
- Modifying the Controller Security Key, on page 95
- Modifying Controller Security Key and the Key ID, on page 95
- Retrieving Network Time Protocol (NTP) Properties, on page 96
- Configuring Network Time Protocol (NTP) Properties, on page 96
- Retrieving all Cisco IMC Users, on page 96
- Setting up ID 11 Cisco IMC User With Username and Password and Enabling Login Access to this User, on page 97
- Disabling or Enabling Strong Password, on page 98
- Retrieving Memory Unit Statistics, on page 98
- Retrieving Specific DIMM Memory Unit Statistics, on page 98
- Retrieving Processor Environment Statistics, on page 99
- Retrieving Specific DIMM Processor Environment Statistics, on page 99
- Retrieving Motherboard Temperature Statistics, on page 99
- Retrieving Specific DIMM Motherboard Temperature Statistics, on page 100
- Retrieving Motherboard Power Statistics, on page 100
- Retrieving Specific DIMM Motherboard Power Statistics, on page 100

- Retrieving iSCSI Parameters, on page 101
- Removing iSCSI Boot, on page 101
- Retrieving Fault Objects Identified by Cisco IMC, on page 101
- Generating Temporary Authentication Tokens and Launching the KVM, on page 102
- Retrieving usNIC Device Parameters, on page 102
- Creating Ethernet Interface usNIC Profiles, on page 103
- Modifying Ethernet Interface usNIC Profiles, on page 103
- Retrieving LDAP Server Details, on page 104
- Configuring LDAP Server IP Address and Port Numbers, on page 104
- Configuring LDAP Parameters, on page 105
- Querying to Check Cisco IMC for NI-IOD Support, on page 106
- Triggering Snapshot based on Parameters Provided with Request, on page 106
- Querying Status of Current or Previous Snapshot Operation, on page 107
- Retrieving the Existing Fault Events on a Server, on page 108
- Retrieving Object and Fault Details of an affectedDn, on page 108
- Retrieving Fault Details of a Fault Dn, on page 109
- Configuring BIOS Parameters Across Various Platforms Using a Master XML Request, on page 109
- Retrieving TPM Information, on page 112
- Retrieving PCI Slot Information, on page 113

- Viewing the Status of Enabling Secure Firmware Update for Adapters, on page 157

Using Cisco IMC LDAP User Credentials to Establish XML API Session Cookie

Request:

```
<aaaLogin inName='admin' inPassword='cisco@123' />
```

Response:

```
<aaaLogin cookie="" response="yes"
outCookie="1461753405/e60c76e8-3175-1175-8002-4cc92474a254"
outRefreshPeriod="600" outPriv="admin"
outSessionId="17" outVersion="3.0 (0.149)">
</aaaLogin>
```

Retrieving Cisco IMC User Sessions

Request:

```
<configResolveClass cookie='1385080136/1a887a90-ebb9-1bb9-8007-130bcc74a254'
classId='aaaSession' inHierarchical='true'>
</configResolveClass>
```

Response:

```
<configResolveClass cookie="1385080136/1a887a90-ebb9-1bb9-8007-130bcc74a254"
response="yes" classId="aaaSession">
<outConfigs>
<aaaSession host="10.10.10.10" id="18" ui="shell" user="admin"
dn="sys/user-ext/term-18" ></aaaSession>

        status="modified" >
      </biosVfPStateCoordType>
    </biosSettings>
  </outConfig>
</configConfMo>

```

Note

The request and response in the preceding example is not the complete output, only a part of it has been included.

This will set the BIOS parameters such as the Processor, Memory, QPI, PCI, Serial, LOM and PCIe slots configuration settings to platform-default values. Similarly, you can configure the BIOS parameters by changing the platform-default input parameter in the example to what you want to configure.

Setting the Out-Of-Band-Mgmt-Port BIOS Token Value

Request:

```
<configConfMo cookie="1462352296/f3b4e630-3200-1200-8002-f0fa5ff6083c"
inHierarchical="false" dn="sys/rack-unit-1/bios/bios-settings/OoB-MgmtPort">
<inConfig>
    <biosVfOutOfBandMgmtPort dn="sys/rack-unit-1/bios/bios-settings/OoB-MgmtPort"
vpOutOfBandMgmtPort="Disabled"

```

Response:

```
<configConfMo dn="sys/rack-unit-1/bios/bios-settings/OoB-MgmtPort"
cookie="1462352296/f3b4e630-3200-1200-8002-f0fa5ff6083c" response="yes">
<outConfig>
    <biosVfOutOfBandMgmtPort dn="sys/rack-unit-1/bios/bios-settings/OoB-MgmtPort"
vpOutOfBandMgmtPort="Disabled" status="modified"

```

Using TFTP to Export Cisco IMC Configuration Data

Request:

```
<configConfMo cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388"
inHierarchical="false" dn="sys/export-config">
<inConfig>
    <mgmtBackup dn="sys/export-config" adminState="enabled" hostname="198.xx.210.xx"
    remoteFile="/tftpserver/c250_config_export.cfg"

```

Response:

```
<configConfMo cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388"
response="yes" dn="sys/export-config">
<outConfig>
    <mgmtBackup dn="sys/export-config" adminState="disabled" fsmStageDescr="Completed
successfully"
    fsmRmtInvErrCode="" fsmRmtInvErrDescr="NONE" fsmDescr="export-config" proto="tftp"
    hostname=""
    remoteFile="" user="" pwd="" passphrase="" status="modified"

```

The preceding request launches the export operation, which executes as a background task.

The exported configuration file resembles the following example:

```
[root]# cat /tftpserver/c250_config_export.cfg
<root><CIMC>
<version>1.4(0.22)</version>
<network>
<hostname>ucs-c250-M2</hostname>
<mode>dedicated</mode>
<redundancy>active-standby</redundancy>
<dns-use-dhcp>no</dns-use-dhcp>
<preferred-dns-server>0.0.0.0</preferred-dns-server>
```

```
<alternate-dns-server>0.0.0.0</alternate-dns-server>
<vlan-enabled>no</vlan-enabled>
.
.
```

TFTP used in the preceding example is the default protocol. You can also export the Cisco IMC configuration using the other available protocols such as the ftp, sftp, scp and http. Exporting using the ftp, sftp and scp requires user credentials, as shown in the following example:

Request:

```
configConfMo cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388"
  inHierarchical="false" dn="sys/export-config"
  <inConfig>
    <mgmtBackup dn="sys/export-config" adminState="enabled"
      hostname="bxxxx-xxx-fileserver.cisco.com" proto="ftp"
      user"username" pwd"password" passphrase='passphrase'
      remoteFile="/home/xxxxx/ppapi.xml">
  </inConfig>
```

Response:

```
<configConfMo cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388" response="yes">
  dn="sys/export-config"
  <outConfig>
    <mgmtBackup dn="sys/export-config" adminState="disabled"
      fsmStageDescr="Completed successfully" fsmRmtInvErrCode=""
      fsmRmtInvErrDescr="NONE"
      fsmDescr="export-config" proto="ftp" hostname="" remoteFile=""
      User="" pwd="" passphrase="" status="modified"/>
  </outConfig>
</configConfMo>
```

Using TFTP to Import Cisco IMC Configuration Data

Request:

```
<configConfMo cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388"
  inHierarchical="false" dn="sys/import-config"mgmtImporter dn="sys/import-config" adminState="enabled" hostname"10.10.10.10"
      remoteFile="/tftpserver/c250_config_export.cfg" user="user" pwd="password"
      passphrase="passphrase"/>
  </inConfig>
</configConfMo>
```

Response:

```
<configConfMo cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388"
  response="yes" dn="sys/import-config"fsmDescr="import-config" proto="tftp"
      hostname=""
      remoteFile="" user="" pwd="" passphrase="" status="modified"/>
  </outConfig>
</configConfMo>
```

The preceding request launches the import operation, which executes as a background task. You can periodically query for the completion status by sending the following requests:

Status request:

```
<configResolveClass cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388"
  inHierarchical="false" classId="mgmtImporter"

```

Status response before completion:

```
<configResolveClass cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388" response="yes"
    classId="mgmtImporter">
<outConfig>
    <mgmtImporter dn="sys/import-config" adminState="enabled"
        fsmStageDescr="Applying configuration" fsmRmtInvErrCode=""
        fsmRmtInvErrDescr="NONE" fsmDescr="import-config" proto="none" hostname=""
        remoteFile="" user="" pwd="" />
</outConfig>
</configResolveClass>
```

Repeated status request:

```
<configResolveClass cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388"
inHierarchical="false" classId="mgmtImporter"/>
```

Status response after completion:

```
<configResolveClass cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388" response="yes"
    classId="mgmtImporter">
<outConfig>
    <mgmtImporter dn="sys/import-config" adminState="disabled"
        fsmStageDescr="Completed successfully" fsmRmtInvErrCode=""
        fsmRmtInvErrDescr="NONE" fsmDescr="import-config" proto="none" hostname=""
        remoteFile="" user="" pwd="" />
</outConfig>
</configResolveClass>
```

Using TFTP to Export Cisco IMC Technical Support Data

Request:

```
<configConfMo cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388"
inHierarchical="false" dn="sys/rack-unit-1/tech-support">
<inConfig>
    <sysdebugTechSupportExport dn="sys/rack-unit-1/tech-support" adminState="enabled"
        remoteFile="/tftpserver/c250_techsupport_archive.tgz" proto="tftp"
        hostname="198.xx.xxx.14" />
</inConfig>
</configConfMo>
```

Response:

```
<configConfMo cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388" response="yes"
dn="sys/rack-unit-1/tech-support">
<outConfig>
    <sysdebugTechSupportExport dn="sys/rack-unit-1/tech-support" adminState="disabled"
        hostname="198.xx.xxx.14" proto="tftp"
        remoteFile="/tftpserver/c250_techsupport_archive.tgz" fsmStageDescr="none"
        fsmProgr="0" fsmStatus="nop" status="modified" />
</outConfig>
</configConfMo>
```

The preceding request launches the technical support generation, after technical support data is generated, it is uploaded to the remote location. You can periodically query for the completion status by sending the following requests:

Status request:

```
<configResolveClass cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388"
inHierarchical="false" classId="sysdebugTechSupportExport"/>
```

Status response before completion:

```
<configResolveClass cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388" response="yes"
```

```

<classId="sysdebugTechSupportExport">
<outConfig>
  <sysdebugTechSupportExport dn="sys/rack-unit-1/tech-support" adminState="enabled"
    hostname="10.10.10.10" proto="tftp"
    remoteFile="/tftpserver/c250_techsupport_archive.tgz"
    fsmStageDescr="collecting" fsmProgr="0" fsmStatus="exporting"/>
</outConfig>
</configResolveClass>

```

Repeated status request:

```
<configResolveClass cookie="1313118253/2b07f100-aa46-1a46-8008-5e61c2e14388"
inHierarchical="false" className="sysdebugTechSupportExport"/>
```

Status response after completion:

```
<configResolveClass cookie="1313118253/2b07f100-aa46-8008-5e61c2e14388" response="yes">
<classId="sysdebugTechSupportExport">
<outConfig>
  <sysdebugTechSupportExport dn="sys/rack-unit-1/tech-support" adminState="disabled"
    hostname="10.10.10.10" proto="tftp"
    remoteFile="/tftpserver/c250_techsupport_archive.tgz"
    fsmStageDescr="completed" fsmProgr="100" fsmStatus="success"/>
</outConfig>
</configResolveClass>
```

The exported technical support file resembles the following example:

```
[root]# tar tvfz /tftpserver/c250_techsupport_archive.tgz | more
drwxr-xr-x root/root          0 2011-08-11 13:01:10 obfl/

        type="blade-bios" status="modified"/>
</outConfig>
</configConfMo>

```

The preceding Cisco IMC and BIOS firmware upgrade examples use tftp as the protocol, similarly you can use other available protocols, such as ftp, sftp, scp and http. When you use the sftp, ftp or scp protocol while updating, username and password has to be specified in the input parameters.

**Note**

BIOS firmware update using the XML APIs is supported only for the following servers:

- Cisco UCS C22 M3 Server
- Cisco UCS C24 M3 Server
- Cisco UCS C220 M3 Server
- Cisco UCS C240 M3 Server
- Cisco UCS C420 M3 Server
- Cisco UCS C220 M4 Server
- Cisco UCS C240 M4 Server
- Cisco UCS C460 M4 Server

Using Non-Interactive HUU to Update Firmware on all C-Series Server Components

Request:

```
<configConfMo cookie="0000020175/b2909140-0004-1004-8002-cdac38e14388"
inHierarchical="true" dn='sys/huu/firmwareUpdater'>
<inConfig>
  <huuFirmwareUpdater dn='sys/huu/firmwareUpdater' adminState='trigger'
remoteIp='10.xxx.xxx.99' remoteShare='/home/xxxxxx/ucs-c220-huu-1.5.0.67.iso'
mapType='cifs' username='user' password='pwd' stopOnError='yes'
timeOut='25' verifyUpdate='yes' updateComponent='all' />
</inConfig>
</configConfMo>
```

Response:

```
<configConfMo dn="sys/rack-unit-1/bios/fw-updatable"
cookie="0000286104/a1778199-0042-1042-8003-7e573e8f835c" response="yes">
<outConfig>
  <firmwareUpdatable dn="sys/rack-unit-1/bios/fw-updatable" description="BIOS firmware
version"
adminState="triggered" deployment="primary" operState="updating"
version="C3X60M3.2.0.12.3.031720160046" protocol="none" remoteServer="" remotePath=""
user="" pwd="" progress="Image Download (5 %), OK" type="blade-bios"
status="modified"/>
</outConfig>
</configConfMo>
```

The preceding example initiates and updates the firmware on all components of the server, you can periodically run the following request to check the status of the update:

Status request:

```
<configResolveClass cookie="1360030993/e4404760-d4f0-14f0-8004-1ec9e1a85750"

adminState="triggered" descr="import-config" proto="none" hostname="" remoteFile=""
user="" pwd="" progress="Done" status="modified"/>
</outConfig>
```

```
</configConfMo>
```

Using TFTP to Update VIC Firmware

Request:

```
<configConfMo cookie="0000286104/a1778199-0042-1042-8003-7e573e8f835c" inHierarchical="true" dn="sys/rack-unit-1/adaptor-1/mgmt/fw-updatable">
  <inConfig>
    <firmwareUpdatable adminState="trigger" dn="sys/rack-unit-1/adaptor-1/mgmt/fw-updatable" protocol="tftp" remoteServer="10.10.10.10" remotePath="cruzfw1.bin" type="adaptor"/>
  </inConfig>
</configConfMo>
```

Response:

```
<configConfMo dn="sys/rack-unit-1/adaptor-1/mgmt/fw-updatable" cookie="0000286104/a1778199-0042-1042-8003-7e573e8f835c" response="yes">
  <outConfig>
    <firmwareUpdatable dn="sys/rack-unit-1/adaptor-1/mgmt/fw-updatable" description="Cisco VIC adapter backup firmware version" adminState="triggered" deployment="backup" operState="Idle" version="4.1(1d)" protocol="none" remoteServer="" remotePath="" user="" pwd="" progress="Stage: No operation (0%), Status: Idle, Error: No error" type="adaptor" status="modified"/>
  </outConfig>
</configConfMo>
```

The preceding example initiates and updates the firmware on VIC, you can periodically run the following request to check the status of the update:

Status request:

```
<configResolveDn cookie="1350860496/b80c15e8-cc99-1c99-8011-1fc9e1a85750" inHierarchical="true" dn="sys/rack-unit-1/adaptor-1/mgmt/fw-updatable"/>
```

Status response after completion:

```
<configResolveDn cookie="1350860496/b80c15e8-cc99-1c99-8011-1fc9e1a85750" response="yes" dn="sys/rack-unit-1/adaptor-1/mgmt/fw-updatable">
  <outConfig>
    <firmwareUpdatable dn="sys/rack-unit-1/adaptor-1/mgmt/fw-updatable" adminState="triggered" deployment="backup" version="2.x(0.xxx)" protocol="tftp" remoteServer="" remotePath="" user="" pwd="" progress="Successful" type="adaptor" >
      </firmwareUpdatable>
  </outConfig>
</configResolveDn>
```

Configuring VIC Adapter Parameters

Request:

```
<configConfMo cookie="0000356151/3380bf82-0053-1053-8004-7e573e8f835c" inHierarchical="true" dn="sys/rack-unit-1/adaptor-1">

Creating Boot Entry for a Fibre Channel Interface

Request:

```

<configConfMo cookie="0000360672/c2450e1c-0054-1054-8006-7e573e8f835c"
  inHierarchical="true" dn="sys/rack-unit-1/adaptor-1/host-fc-fc0/fcboot-0">
  <inConfig>
    <adaptorFcBootTable dn="sys/rack-unit-1/adaptor-1/host-fc-fc0/fcboot-0"
      targetWwpn="20:11:22:33:44:55:66:78" bootLun="1" status="created"/>
  </inConfig>
</configConfMo>

```

Response:

```

<configConfMo dn="sys/rack-unit-1/adaptor-1/host-fc-fc0/fcboot-0"
  cookie="0000360672/c2450e1c-0054-1054-8006-7e573e8f835c" response="yes">
  <outConfig>
    <adaptorFcBootTable index="0" targetWwpn="20:11:22:33:44:55:66:78" bootLun="1"
      dn="sys/rack-unit-1/adaptor-1/host-fc-fc0/fcboot-0" status="created"/>
  </outConfig>
</configConfMo>

```

Configuring HUU for One-Time Boot

Request:

```

<configConfMo cookie='1342064443/ba6bccf0-c499-1499-8002-134c9ee53d50'
  inHierarchical='false' dn='sys/rack-unit-1/boot-one-time'>
  <inConfig>
    <oneTimeBootDevice device='huu' dn='sys/rack-unit-1/boot-one-time'>
      </oneTimeBootDevice>
    </inConfig>
</configConfMo>

```

You can verify this in the user interface. Similar to this example, you can also set SCU and HV as one-time boot devices.

Mounting Share to the VMedia with Username

Unlocking Secure Drives on Controllers

If you want to import secure drives to a controller from other controllers, you must first unlock these secure drive that you want import. The following XML API request helps you to unlock drives:

Request:

```
<configConfMo cookie="1445440951/5715265f-229f-129f-8004-c6efa42fa074"
inHierarchical="false" dn="sys/rack-unit-1/board/storage-SAS-SLOT-HBA/ctr-self-encrypt">
<inConfig>
<selfEncryptStorageController
dn="sys/rack-unit-1/board/storage-SAS-SLOT-HBA/ctr-self-encrypt"
securityKey="t" adminAction="unlock-secured-drives"/>
</inConfig>
</configConfMo>
```

Response:

Run a **configResolveClass** with class ID **storageLocalDisk** and verify that **Locked** is set to **no** and **fdeCapable**, **fdeEnabled**, **Secured** and **ForeignLocked** are **yes**.

Erasing Data on Secure Unconfigured Good Drives

Request:

```
<configConfMo cookie="1440644344/0ffb96f5-1e43-1e43-8002-a4f07b6138b8">
  inHierarchical="false" dn="sys/rack-unit-1/board/storage-SAS-SLOT-HBA/pd-4">
    <inConfig>
      <storageLocalDisk adminAction="disable-self-encrypt">
        dn="sys/rack-unit-1/board/storage-SAS-SLOT-HBA/pd-4">
      </storageLocalDisk>
    </inConfig>
  </configConfMo>
```

Response:

```

Generating Temporary Authentication Tokens and Launching the KVM

Launching the KVM console using the XML APIs include the following:

- Retrieving a session cookie.
- Generating temporary authentication tokens.
- Accessing the URL to download the JNLP file using the tokens.
- Launching the KVM.

Request for obtaining authentication tokens:

```
<aaaGetComputeAuthTokens cookie="1363034734/412ce290-d7ac-17ac-8006-c979e5e53d50" />'
```

Response for obtaining authentication tokens:

```
<aaaGetComputeAuthTokens cookie="1363034734/412ce290-d7ac-17ac-8006-c979e5e53d50"
  outTokens="1957747793,424238335" response="yes">
</aaaGetComputeAuthTokens>
```

To access the URL, use the tokens in the tkn1 and tkn2 parts of the following URL within 60 seconds of generation:

```
javaws http://<Cisco IMC IP address>/kvm.jnlp?cimcAddr=<Cisco IMC IP
address>&tkn1=1957747793&tkn2=424238335
```

Download the JNLP file from the URL and launch it to start a KVM session.

Retrieving usNIC Device Parameters

Configuring LDAP Parameters

You can configure LDAP parameters such as, LDAP status, encryption, timeout, domain, base Dn, binding parameters, DNS parameters, group authorization parameters, LDAP role groups and so on. The following example shows configuring LDAP parameters:

Request:

```

<configConfMo cookie="1351062607/c6c74fd8-ccc8-1cc8-8005-1ec9ela85750"
inHierarchical="true" dn="sys/ldap-ext">
<inConfig>
  <aaaLdap dn="sys/ldap-ext" adminState="enabled" basedn="ExampleDn"
    domain="Example.com" filter="MySAMAccountNameYes" attribute="CiscoAviator"
    timeout="160" encryption="enabled" locateDirectoryUsingDNS="no"
    dnsDomainSource="extracted-domain" dnsSearchDomain="child.cp.com"
    dnsSearchForest="cp.com"
    ldapServer1="172.26.53.36" ldapServerPort1="636"

Configuring BIOS Parameters Across Various Platforms Using a Master XML Request

Using the XML API interface, you can use the master BIOS parameters configuration XML request to configure BIOS parameters across different C-series servers. The BIOS parameters in this master XML request that are not supported on a specific platform are ignored. The supported parameters are configured as specified in the XML request.

Request:

```
<configConfMo dn="sys/rack-unit-1/bios/bios-settings"

```

Notes on Using the configConfMo Method

This appendix includes the following topics:

- Defining a Distinguished Name using the configConfMo Method, [page 159](#)
- Using the Optional inHierarchical Attribute, [page 160](#)
- Configuring a Single Managed Object, [page 160](#)

Defining a Distinguished Name using the configConfMo Method

The **configConfMo** method is used to configure one or more properties in a Managed Object (MO). The MO to be configured is uniquely identified by a Distinguished Name (DN). This chapter shows two ways to provide a DN using the **configConfMo** method.

At the Managed Object Level

You can provide a DN at the Managed Object level. In the following example, the DN "sys/rack-unit-1/locator-led" is defined within the "equipmentLocatorLed" MO.

```
<configConfMo  
    cookie=<real_cookie>>  
    <inConfig>  
        <equipmentLocatorLed  
            adminState='on'  
            dn='sys/rack-unit-1/locator-led'>  
        </equipmentLocatorLed>  
    </inConfig>  
</configConfMo>
```

<== MO level

At the Method and Managed Object Level

You can provide a DN at the Method and Managed Object level. In the following example, the DN "sys/rack-unit-1/locator-led" is defined at the **configConfMo** method level and within the "equipmentLocatorLed" MO.

```
<configConfMo  
    cookie=<real_cookie>  
    dn='sys/rack-unit-1/locator-led'>  
    <inConfig>  
</inConfig>
```

<== Method level

```

<equipmentLocatorLed
    adminState='on'
    dn='sys/rack-unit-1/locator-led'>
</equipmentLocatorLed>
</inConfig>
</configConfMo>
```

<== MO Level

Note Specifying a DN at the Method level is optional, and is supported in the Cisco IMC XML API implementation to be consistent with the Cisco UCS Manager XML API implementation.

Using the Optional inHierarchical Attribute

When a **configConfMo** request is sent to Cisco IMC, the response contains only the immediate properties of the MO being configured.

When the optional **inHierarchical** attribute is included in the **configConfMo** request, the response will be similar to that of the **configResolveDn** request with the **inHierarchical** attribute set to true. The response contains the properties for the MO being configured along with the properties of any children MOs.

Request:

```

<configConfMo
    cookie=<real_cookie>
    inHierarchical="true"
    dn='sys/rack-unit-1/locator-led'>
    <inConfig>
        <equipmentLocatorLed
            adminState='on'
            dn='sys/rack-unit-1/locator-led'>
        </equipmentLocatorLed>
    </inConfig>
</configConfMo>
```

Response:

```

<configConfMo
    dn="sys/rack-unit-1/locator-led"
    cookie=<real_cookie>
    response="yes">
    <outConfig>
        <equipmentLocatorLed
            dn="sys/rack-unit-1/locator-led"
            adminState="inactive"
            color="unknown"
            id="1"
            name=""
            operState="on">
        </equipmentLocatorLed>
    </outConfig>
</configConfMo>
```

Configuring a Single Managed Object

The Cisco IMC XML API implementation accepts only **configConfMo** methods that operate on a single Managed Object (MO). It is invalid to specify a **configConfMo** method that contains multiple MOs even if they are defined in a containment relationship in the Cisco IMC management information model.

The following example shows a valid **configConfMo** method to configure a single MO, "lsbootLan." In this example, the host is configured to use PXE Boot as the first boot option:

```
<configConfMo
    cookie=<real_cookie>>
    <inConfig>
        <lsbootLan>
            order="1"
            status="modified"
            dn="sys/rack-unit-1/boot-policy/lan" >
        </lsbootLan>
    </inConfig>
</configConfMo>
```

<== Single MO

The **configConfMo** method in the following example is invalid because a Parent and Child MOs are specified at the same time. The "equipmentLocatorLed" and "solIf" MOs are child objects of the "computeRackUnit" MO in the management information tree. The Cisco IMC XML API implementation does not allow a **configConfMo** method to perform subtree configurations.

Request:

```
<configConfMo
    cookie="1313084260/40ea8058-aa3e-1a3e-8004-5e61c2e14388"
    dn="sys/rack-unit-1" inHierarchical="false">
    <inConfig>
        <computeRackUnit>
            adminPower="cycle-immediate"
            usrLbl="Cisco C210 Server"
            dn="sys/rack-unit-1">
                <equipmentLocatorLed>
                    adminState="on"
                    dn="sys/rack-unit-1/locator-led"/>
                <solIf>
                    dn="sys/rack-unit-1/solif"
                    adminState="enable"
                    speed="9600"/>
                </equipmentLocatorLed>
            </computeRackUnit>
        </inConfig>
    </configConfMo>
```

<== Parent MO

<== Child MO

<== Child MO

Response:

XML PARSING ERROR: Element 'equipmentLocatorLed': This element is not expected.

Note This method is valid in the Cisco UCS Manager XML API implementation but is not supported in the Cisco IMC XML API implementation.

The Cisco IMC Visore Utility

Visore is a utility built into Cisco IMC that allows a user to easily browse Managed Objects (MOs) using an HTML browser. The Visore utility uses the Cisco IMC XML API query methods to browse the MOs active in Cisco IMC. The Visore utility cannot be used to perform configuration operations.

Accessing Visore

To access Visore, open a browser and enter one of the following URLs:

- <http://<Cisco IMC IP Address>/visore.html>
- <https://<Cisco IMC IP Address>/visore.html>

When prompted, log in using the same credentials you would use to log in to the Cisco IMC CLI or GUI user interfaces.

Note

In Cisco IMC Release 1.5(1x), only the Firefox and Chrome browsers are supported for Visore access.

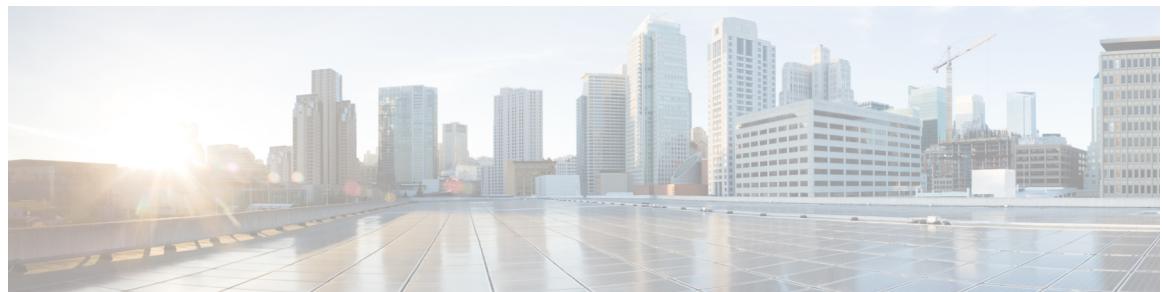

Using Visore to Query a Class

To query for a particular class, enter the class name in the **Class or DN** field and click **Run Query**. Visore sends a **configResolveClass** method to Cisco IMC and the requested MO is displayed in a tabular format..

Use the < and > buttons to retrieve the Parent and Child class of the displayed MO. For example, clicking > sends a **configResolveChildren** method to Cisco IMC to query for the child of the MO. Clicking < sends a **configResolveParent** method to Cisco IMC to query for the parent of the MO.

Using Visore to Query a Distinguished Name(DN)

To query for a particular DN, enter the DN in the **Class or DN** field and click **Run Query**. Visore sends a **configResolveDn** method to Cisco IMC.
