aaaGetComputeAuthTokens

The `aaaGetComputeAuthTokens` method returns authentication tokens that are used to launch the KVM. This generates two temporary authentication tokens that are valid for 60 seconds. The first is the KVM user name and the second token is the password. Using the authorization tokens as credentials, you can access the URL from where you can download the Java Network Launch Protocol (JNLP) file. You can download the JNLP file from the URL and launch it to start a KVM session.

**Note**

- You cannot obtain tokens if the vKVM option is disabled on the Cisco IMC.
- You must have user or admin privileges to the Cisco IMC to obtain the authentication tokens. Users with read-only privileges will not be able to obtain the tokens.
- The authorization tokens expire is 60 seconds; you cannot use the tokens after 60 seconds to access the URL. If you try to access after 60 seconds, the login fails and you get a authentication failure or timeout message.

aaaLogout

The aaaLogout method is a process to close a web session by passing the session cookie as input. It is not automatic; the user has to explicitly invoke the aaaLogout method to terminate the session.

```

Response

```

aaaRefresh

The aaaRefresh method keeps sessions active (within the default session time frame) by user activity. There is a default of 600 seconds that counts down when inactivity begins. If the 600 seconds expire, Cisco IMC enters a sleep mode. It requires signing back in, which restarts the countdown. It continues using the same session ID.

**Note**

Using this method expires the previous cookie and issues a new cookie.

eventSubscribe

The eventSubscribe method allows a client to subscribe to asynchronous System Event Log (SEL) events generated by Cisco IMC.

Event subscription allows a client application to register for event notification from Cisco IMC. When an event occurs, Cisco IMC informs the client application of the event and its type. Only the actual change information is sent. The object's unaffected attributes are not included.

Use eventSubscribe to register for events as shown in the following example:

```
<eventSubscribe
  cookie="<real_cookie">
</eventSubscribe>
```

Request Syntax

```
<xs:element name="eventSubscribe" type="eventSubscribe" substitutionGroup="externalMethod"/>
  <xs:complexType name="eventSubscribe" mixed="true">
    <xs:attribute name="cookie" type="stringMin0Max47" use="required"/>
    <xs:attribute name="response" type="YesOrNo"/>
  </xs:complexType>
```

Response Syntax

```
<xs:element name="eventSubscribe" type="eventSubscribe"
substitutionGroup="externalMethod"/>
  <xs:complexType name="eventSubscribe" mixed="true">
    <xs:attribute name="cookie" type="xs:string"/>
    <xs:attribute name="response" type="YesOrNo"/>
    <xs:attribute name="errorCode" type="xs:unsignedInt"/>
    <xs:attribute name="errorDescr" type="xs:string"/>
    <xs:attribute name="invocationResult" type="xs:string"/>
  </xs:complexType>
```

eventUnsubscribe

The eventUnsubscribe method allows a client to unsubscribe from asynchronous System Event Log (SEL) events generated by Cisco IMC, reversing event subscriptions that resulted from eventUnsubscribe.

Use eventUnsubscribe to unsubscribe from events as shown in the following example:

```
<eventUnsubscribe
  cookie="<real_cookie>">
</eventUnsubscribe>
```

Request Syntax

```
<xs:element name="eventUnsubscribe" type="eventUnsubscribe"
  substitutionGroup="externalMethod"/>

    <xs:attribute name="response" type="YesOrNo"/>
  </xs:complexType>
```

Response Syntax

```
<xs:element name="eventUnsubscribe" type="eventUnsubscribe"
  substitutionGroup="externalMethod"/>
  <xs:complexType name="eventUnsubscribe" mixed="true">
    <xs:attribute name="cookie" type="xs:string"/>
    <xs:attribute name="response" type="YesOrNo"/>
    <xs:attribute name="errorCode" type="xs:unsignedInt"/>
    <xs:attribute name="errorDescr" type="xs:string"/>
    <xs:attribute name="invocationResult" type="xs:string"/>
