

Printer Services

Bonjour Printer Services

In most networks, the printers are wired into the network. You can also show case and verify that the AirPrint Services are being cached and advertised by the controller when the client queries for the service. The same principal applies as discussed above for the wired Bonjour device (Apple TV).

1. To check if the Bonjour Printer Service is discovered by the WLC, navigate to **CONTROLLER > mDNS > Domain Names**. The printer appears under Domain Name IP Entries with Type Wired and Vlan Id.

Domain Name	MAC Address	IP Address	Vlan Id	Type	TTL (sec)
Apple-TV4.local	9c:20:7b:91:c3:9d	10.10.11.56	11	Wireless	4725
HPC43CDE-2.local	00:9c:02:e4:3c:de	10.10.105.4	105	Wired	4725

2. A single Bonjour device can advertise multiple Bonjour services; for example, a printer can advertise AirPrint, Printer, Scanner, Photosmart, and so forth. To confirm which service is being cached by the WLC, go to **CONTROLLER > mDNS > General**, and click the appropriate service name.

The screenshot shows the Cisco WLC configuration interface for mDNS. The left sidebar has 'mDNS' selected. The main content area shows the 'mDNS' configuration page. Under 'Master Services Database', there is a table of services. A red arrow points to the 'AirPrint' service name in the table.

Service Name	Service String	Query Status
AirPrint	_ipp._tcp.local.	<input checked="" type="checkbox"/>
AppleTV	_airplay._tcp.local.	<input checked="" type="checkbox"/>
HP_Photosmart_Printer_1	_universal._sub._ipp._tcp.local.	<input checked="" type="checkbox"/>
HP_Photosmart_Printer_2	_cups._sub._ipp._tcp.local.	<input checked="" type="checkbox"/>
Printer	_printer._tcp.local.	<input checked="" type="checkbox"/>
Scanner	_scanner._tcp.local.	<input checked="" type="checkbox"/>

Note

Any printer services that advertise Service String `_ipp._tcp.local` are cached by the WLC under Service Name AirPrint. Likewise, if the printer also advertises the string `_printer._tcp.local`, it appears under the Printer service name

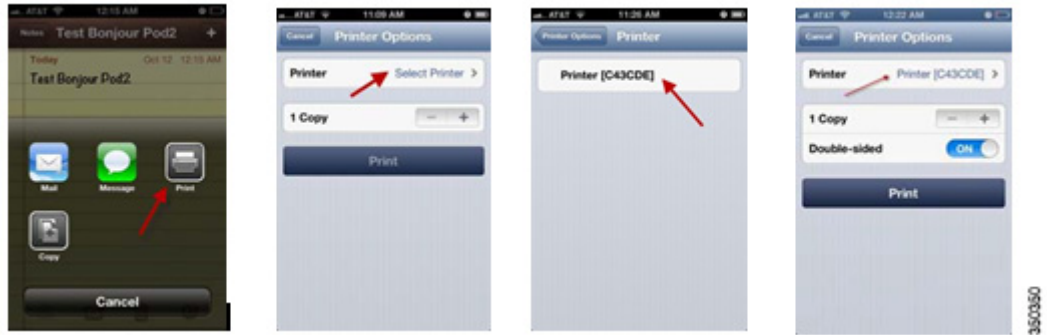

Below, the Bonjour printer advertises the AirPrint Service and is part of default-mdns-profile.

The screenshot shows the Cisco WLC configuration interface for mDNS Service Detail. The left sidebar has 'mDNS' selected. The main content area shows the 'mDNS Service > Detail' page. A red arrow points to the 'AirPrint' service name in the 'Service Name' field. Another red arrow points to the 'Printer [C43CDE]_ipp._tcp.local.' service provider name in the 'Service Provider Name' field. A third red arrow points to the 'Wired' type in the 'Service Provider Information' table.

MAC Address	Service Provider Name	Vlan Id	Type	TTL (seconds)	Time Left (seconds)
00:9c:02:c4:3c:de	Printer [C43CDE]_ipp._tcp.local.	105	Wired	4500	3577

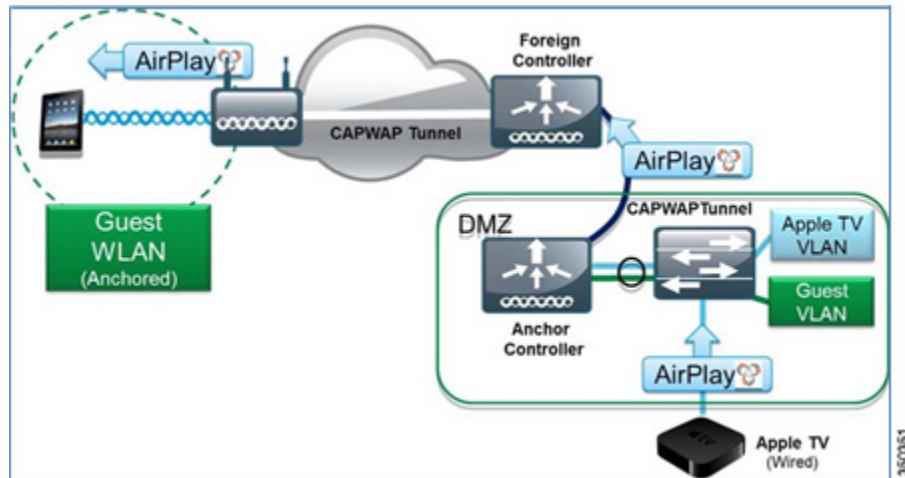

3. Once the services are visible on the WLC, check if wired Bonjour Printer services are routed across the VLANs and if the printer is detected by your iOS device. Make sure your Apple iPhone/iPad Client is connected the client SSID.
4. Use your iOS device to test the AirPrint services.
 - a. As shown below, click the Print icon in iOS6 or click the Print tab in iOS5.
 - b. Under Printer Options, click Select Printer to see the Bonjour printer that was discovered by the device.

c. Select that printer, and click Print to test the AirPrint Services.

Bonjour and Guest Anchoring

For guest anchoring, the guest WLAN is able to see Bonjour services advertised to the anchor controller. The Bonjour queries and advertisements are sent inside the Control and Provisioning of Wireless Access Points (CAPWAP) tunnel.

Bonjour Layer 3 Roaming

The Layer 3 roaming works across the Ethernet over IP (EoIP) tunnel to ensure users moving among access points (APs) on different controllers continue to see the devices they saw on the original controller.

The Bonjour services on the anchor controller are displayed to the client, including both wired and wireless devices.

Bonjour Services Summary

- The 7.4 release supports up to 64 services and 100 service providers per service type.
- Each service provider is registered in the WLC as its domain name.
- A client that meets the profile requirements receives unicast service directly from the service provider.
- Each Bonjour service has an advertised TTL. The controller asks the device for an update at 85% of this TTL.

Bonjour Services Support in FlexConnect Mode

- For centrally switched WLANs, the behavior for Bonjour is the same as if the AP was in local mode.
- Bonjour queries from the client are sent to the controller and Bonjour responses from the controller are sent back to the AP in the unicast CAPWAP tunnel.
- FlexConnect APs do not require the Multicast?Unicast mode to support Bonjour.
- For locally switched WLANs, Bonjour continues to work in a single subnet only.

Bonjour Configuration on the WLC Through the CLI

This is a list of command line interface (CLI) commands that can be used to configure Bonjour on the WLC.

Configure Commands

To enable or disable global mDNS snooping

```
WLC>config mdns snooping { enable | disable }
```

To create a new mDNS profile name

```
WLC>config mdns profile create profile-name
```

To delete an existing mDNS profile name

```
WLC>config mdns profile delete profile-name
```

To attach a mDNS profile name to an interface

```
WLC>config interface mdns-profile { management | all interface-name } {profile-name | none}
```

Note If a WLAN is attached to interface, the WLC issues a dependency error.

To attach a mDNS profile name to an interface-group

```
WLC>config interface group mdns-profile { all | interface-group-name } {profile-name | none }
```

Note If a WLAN is attached to Interface, the WLC issues a dependency error.

To enable or disable mDNS support for a WLAN

```
WLC>config wlan mdns { enable | disable } { wlan id | all }
```

Note The default value is enabled.

To attach a mDNS profile to a WLAN

```
WLC>config wlan mdns { profile-name | none } { wlan id | all }
```

To create a new mDNS service

```
WLC>config mdns service create service-name service string query { enable | disable }
```

To enable/disable query for a service

```
WLC>config mdns service query { enable | disable } service-name
```

To delete a mDNS service

```
WLC>config mdns service delete service-name
```

To attach a service to a given profile name

```
WLC>config mdns profile service add service-name profile-name
```

To remove the service from a profile name

```
WLC>config mdns profile service delete service-name profile-name
```

To configure query interval

```
WLC>config mdns query interval interval-value
```

**Note**

The default value is 15 minutes; the range is 10 minutes to 2 hours

Show Commands

```
WLC>show mdns profile summary
WLC>show mdns profile detailed profile-name
WLC>show mdns service summary
WLC>show mdns service detailed service-name
WLC>show interface detailed interface-name
WLC>show interface group detailed interface-group-name
WLC>show wlan wlan-id
WLC>show client detail mac-address
WLC>show network summary
```

Clear Commands

To clear the mDNS database learned dynamically per service

```
WLC>clear mdns service-database { all | service-name }
```

Debug Commands

To display events related to mDNS

```
WLC>debug mdns message { enable | disable }
```

To display mDNS details of the events

```
WLC>debug mdns detail { enable | disable }
```

To display errors related to mDNS processing

```
WLC>debug mdns error { enable | disable }
```

To enable all debugs

```
WLC>debug mdns all { enable | disable }
```

All the debugs can be filtered based on the MAC address.
