## About this Guide

**Note** The documentation set for this product strives to use bias-free language. For purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. While any existing biased terms are being substituted, exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on RFP documentation, or language that is used by a referenced third-party product.

This preface describes the *Ultra Cloud Core Serving Gateway Control Plane Function - Metrics Reference*, the document conventions, and the customer support details.

## Overview

This section provides details of bulk statistics. Bulk statistics are divided in two types:

- Gauge - Snapshot value that shows the statistic at the reporting moment (for example, the number of current UE, current PDN connections). These statistics can increment or decrement continuously.
- Counter - Historic value accumulated over a period (for example, the total number of CSR requests received). These values get incremented except in the following two cases:
  - Rollover - where a counter exceeds its maximum value and rolls over to zero.
  - Reset - where a counter is manually reset to zero.
