How to find a Mac Address for Cisco Meeting Server and (legacy) Acano X products

The following steps provide customers with instructions to find a Mac address for Cisco Meeting Server and Acano X products.

1. For a Cisco Meeting Server or Acano X product:

Obtain the Mac address by logging into the MMP (Mainboard Management Processor) of your server, and enter the following command: **iface a**

```
CMS> iface a
Mac address: 00:0C:29:6F:FD:1B
Configured values:
Auto-negotiation: on
MTU: 1500
```

Note: This is the Mac address of your VM (Virtual Machine), **not** the Mac address of the server platform that the VM is installed on.

For more information about the licensing registration process, please refer to the [LRP Main User Guide](#).

Document Version:

Name	Version	Notes	Date
Anirudh	0.1	Created new document per instructions from BU	07/06/2016
Anirudh	0.2	Updated the product name reference	09/21/2016
Felice	0.3	Added reference for X products to help legacy customers	11/3/2016
James A.	0.4	Added link to LRP Main User Guide	1/11/2017
